1. Introduction

1.1 Buildings and landscape in the AONB

The landscape of the Malvern Hills and surrounding areas have been designated an Area of Outstanding Natural Beauty (AONB) with the primary purpose of conserving and enhancing their natural beauty. Both natural and cultural influences have combined to produce these landscapes which are so highly valued today, and it is commonly accepted that buildings can make a key contribution to the special character of the area.

Buildings help to tell a rich and fascinating story about the history of the area: The location of development in the AONB, the different types of building which have been constructed, and the varying materials which have been used in their construction all help to inform us about how humans have settled and lived in the area and how they have been influenced by the landscape. That story is not complete. This generation, and those that follow, will continue to contribute, adding further layers which in turn will make that narrative richer still.

Landscapes comprise a range of components which influence and are influenced by buildings:

EXPERIENCE: The value of the Malvern Hills AONB landscape is partly reliant upon the standard and character of buildings. It is the responsibility and opportunity of all potential developers to ensure each development adds value to the Malvern Hills AONB landscape through good design.

HISTORY: Settlement in the Malvern Hills AONB illustrates time depth: Evidence of prehistoric settlement on the uplands at British Camp and the hill fort on Midsummer Hill represent secure and defendable lookouts. Timber framed buildings are early buildings using easily available resources. Malvern developed as a spa town in the Victorian period leading to expansion and development from village to town and bringing tourism to the landscape. Colwall altered and changed through the development of the railway.

LAND USE: Patterns of land use and settlement, from farming to residential living, are fundamental to the rich diversity of building types, scales and styles found in the Malverns. These include modest houses found around areas of common land, villas, country houses and traditional farmsteads.
WILDLIFE: Bats and barn owls often inhabit spaces in buildings, whilst many gardens provide feeding and shelter to birds, butterflies, spiders and bees.

NATURAL FORM: Older stone buildings display local geology: local stone was a readily available resource. Land form influences location in terms of proximity of resources such as shelter and water. The local presence of springs had a great influence on the location and type of development.

1.2 The purpose of this document

The purpose of this document is to provide direction and guidance on how new development can make a positive contribution to the natural beauty of the AONB. It does not set out to freeze the past or the present. However, it does recognise that many of the buildings and settlements in existence today have a character which needs to be respected and which can help to inform the buildings of the future. It explains how the landscape itself should continue to play a central role in informing new development, as it has done so effectively in the past.

Design documents of this nature are not without their difficulties. They chart a difficult course between those who are wary of change and those who wish to embrace it, whilst recognising that different people will have strong but often contrasting views on what constitutes 'good' and 'bad' design. This document charts this course by reference to the distinctive character of the Malvern Hills AONB and the needs and challenges of the modern day.

1.3 Who this document is for?

This document provides guidance to everyone involved in developing or altering buildings in the Malvern Hills AONB, including property owners, developers, agents, advisers and architects. It is also targeted at those with responsibility for setting the framework for development and for making decisions about individual planning applications; this includes planning staff and associated colleagues in local authorities. Every single development, from the construction of a new house to the hanging of a new gate, has the potential to make a positive or negative contribution to the Malvern Hills AONB. The guidance in this document will help those who value and care for this area to ensure that future developments contribute to the local distinctiveness and sense of place.

1.4 Status of the Building Design Guide

This document has been produced to help implement the Malvern Hills AONB Management Plan which 'formulates local authority policy for the management of the AONB and for the carrying out of their functions in relation to it' (Section 89 of the Countryside and Rights of Way Act, 2000). The AONB Management Plan is a material consideration in relation to planning. The Building Design Guide amplifies the content of the Management Plan in relation to the buildings of the AONB. Using this document will help public bodies meet their statutory duties to have regard to the purposes of conserving and enhancing the natural beauty of the AONB in exercising or performing any functions in relation to, or so as to affect AONB land (Section 85 of the Countryside and Rights of Way Act, 2000).
2. How to use this guide

The Building Design Guide is split into two main sections: ‘General Guidance’ and ‘Local Guidance’. The 'General Guidance' provides essential information required for good and sustainable design in the Malvern Hills AONB. This section is for everyone who plans to develop or alter buildings within the area. It explains the relationship of buildings to the landscape, the design process, what comprises good design and appropriate building materials to use.

The Local Guidance provides a limited amount of additional, more detailed advice on landscape and local building design for specific areas within the AONB. It should be read more selectively, with users reading the chapter, or chapters, specific to the location of their proposed development or alteration. It should always be read alongside the General Guidance and should not be read in isolation.

Specific guidelines have been developed for ‘Domestic buildings’, ‘Farmsteads and agricultural buildings’ and ‘Shop fronts and signage’. Other development, such as that for a pub or other business can take principles from these chapters. All developments, alterations and conversions should consider the guidelines for ‘Landscape and setting’, ‘Gardens and boundaries’, ‘Materials’ and ‘Details’.

This Building Design Guide is not definitive and must be used alongside existing guidance and policies relevant to the AONB, including but not limited to:

- Malvern Hills AONB Management Plan
- Malvern Hills AONB Landscape Strategy and Guidelines
- County and local Landscape Character Assessments
- County and local Historic Landscape Character Assessments
- Local Village Design Statements and Neighbourhood plans
- Relevant national policies

This Building Design Guide does not cover all aspects of the design and construction process, further advice should be sought on issues such as: building regulations and building control; the planning process and its requirements for obtaining planning permission; Landscape and Visual Impact Assessment and Environmental Impact Assessment; accessibility and legibility; listed buildings and Conservation Areas; sustainability initiatives e.g. BREEAM.

3. Building Design

3.1 Importance of good design

Landscapes and buildings are constantly evolving and changing. New development, extensions and alterations are not new in the Malvern Hills AONB. Changes to the built environment which respect and consider the character of the landscape create positive change by strengthening landscape character. It is important to ensure that future development is locally characteristic and distinctive, in terms of materials, siting and design, in order to sustain the natural beauty of the area. Existing, locally characteristic buildings provide design cues for new development. However, it is important not to simply copy or pastiche existing building style but instead be inspired by this style, developing something which is characteristic both to the place and the time in which it is created. This requires good, individual and thoughtful design.

Good design is essential for all new developments, alterations or extensions within the Malvern Hills AONB. The National Planning Policy Framework (2012)\(^1\) emphasises the link between good design and sustainable development:

“Good design is a key aspect of sustainable development, is indivisible from good planning and should contribute positively to making places better for people.”

Well-designed buildings are likely to be more sustainable as good design can “add value and can lead to a number of economic, social and environmental benefits.”\(^2\) Environmental benefits, in terms of low impact and low carbon design, are increasingly important aspects of good design. Historic buildings provide a link to our past expressing the values of people at that time. The buildings we develop now must provide this same cultural asset for people in the future. Buildings which demonstrate good design are more likely to be valued and cared for, reducing maintenance costs and enhancing the aesthetics of a place. High quality, well-maintained places have a positive effect on community, increasing the sense of pride, reducing the feeling of isolation and helping reduce

crime and fear of crime. Good design can also enhance and reveal the significance of buildings and sites that are designated for their special heritage or natural value.

3.2 Design Process

Successful buildings and places are those which enable local people to take pride in their area, both now and in the future. It is essential that places are environmentally, socially and economically sustainable. This chapter will guide those who are unfamiliar with design through a process that will help to create a sustainable building. It is split into two key stages: develop the brief and; design the building. It is possible to progress with some of the steps simultaneously. The design process is applicable to new buildings, alterations and extensions.

3.2.1 Develop the brief

Developing a brief involves understanding and identifying the challenges and opportunities associated with a site to outline elements such as appropriate orientation, scale and style.

i. Seek advice from the local planning authority and other experts

In the initial stages of the process the local planning authority must be consulted to determine what permissions, such as planning permission and or listed building consent, are required.

ii. Understand the landscape and its setting

A modern design can add to the distinctive qualities of the Malvern Hills AONB if it is based on a strong understanding of the context, setting and landscape character of the site. This will ensure any change upholds the existing qualities which make the area special. Consideration should be given to local building tradition, historical development and building styles (building materials, colour, scale, mass and form), local landmarks, settlement patterns, key views, topography and existing biodiversity. The AONB Partnership, local and county councils hold a variety of documents which can help explain many of these characteristics.

iii. Understand the site

Once the surrounding landscape has been considered, it is important to understand the issues, challenges and potential opportunities of the site itself. The following aspects of the site should be considered:

- Land use
- Weather: movement of the sun, prevailing wind direction and speed
- Views into and out of the site and association with landmarks
- Geology and topography
- Natural features and biodiversity e.g. rivers, lakes, trees, hedgerows, protected species/ habitats, springs/ wells
• Vehicular and pedestrian access, pedestrian and vehicular routes around and into the site (including public rights of way), and key nodes (junctions or other points where people or vehicles meet)
• Types of boundaries (hedge, fence, wall)
• The existing building lines and roof lines of any buildings on the site
• Designations such as listed buildings on the site, Conservation Area or nature conservation designations (e.g. SSSIs)
• Archaeology, historic and cultural associations
• Condition of existing features

iv. Consider sustainable design principles
Consider the following questions before developing designs to ensure a sustainable development.

Are you making a successful place? Good design recognises the relationship/connections between people, buildings and spaces. The building should work well with the space and with other buildings around it, enhancing sense of place and its value to local people, encouraging its use and improving the feeling of safety: An entrance to a residential property which is overlooked by other properties or faces a road may feel safer than an entrance which is not overlooked.

Is this building flexible so it can adapt in the future? Consider how the building could be used in the future; this makes it easier for the building to be adapted to a user’s different requirements over time. For example: providing opportunity to install solar panels on the roof at a later date, or considering adaptations required to make a dwelling more accessible for future needs as residents’ age e.g. provide extra space for installing a stair lift or similar adaptations.

What is the relationship between people and the building? Many buildings, such as residential and commercial buildings, are not for public use, meaning the public will rarely or never enter them. The points at which members of the public do have a relationship with the building, such as the boundaries and frontages, should be attractive and appropriate to landscape character.

Is this place accessible to all? Buildings and spaces must ensure those needing to use them can do so easily, safely and with dignity regardless of age, gender, mobility, ethnicity or circumstances. For example, consider entrance ramps/ lifts, or signage in Braille at entrances to public buildings; the height of light switches on walls; the width of doorways; or the route people will have to take from the road to the front door.

v. Consider energy and resource efficiency
Issues such as energy efficiency, renewable energy and adapting to climate change should be considered at the initial stages of planning. This ensures that energy and resource efficiency measures are designed integrally, making a positive contribution to the aesthetics and avoiding excessive future costs. Further details can be found in the ‘Energy and resources’ chapter.
vi. Consult those affected

Any development, no matter how small, can affect others that live or work nearby. Those affected by, or with an interest in, the development should be spoken to early in the design process and kept informed throughout. For larger developments, interested parties could be involved in planning and designing the development to encourage a greater sense of place and community ownership.

3.2.2 Design process

It may be necessary to work with professionals such as an architect, structural engineer, landscape architect, or a combination of different professionals. A good working relationship with these professionals can help to achieve the project aims and make it more cost effective.

i. Explore different concept designs

This includes exploring different layouts, orientations and types of suitable materials along with energy efficiency measures or renewable technologies which would be appropriate.

ii. Develop detailed options

Discuss options with interested parties and consider if each option could present any problems when built or in the longer term.

iii. Produce final designs

Continue to assess any issues with the design and ensure it meets the brief.

iv. Where necessary, submit a planning application or obtain other approvals

It may be necessary to submit a planning application or obtain other approvals determined at the start of the process before work can begin on site.

- Design Council CABE has produced a variety of publications about good design
PART 1 – GENERAL GUIDANCE

4. Key characteristics of the Malvern Hills AONB Landscape

4.1 Landscape evolution - a historical perspective

The now unsettled uplands of the Malvern Hills were the site of prehistoric settlement, notably at British Camp, on Herefordshire Beacon and at Midsummer Hillfort to the south. The area around the high hills is characterised by lower ridges and well-wooded slopes that have been subject to a long history of coppice woodland management and which were incorporated into medieval deer parks and hunting chases. Strip lynchets and strips of ridge and furrow in small closes are witness to pre-14th century levels of arable production in areas of higher ground which have since been managed as pasture.

There are some nucleated villages to the west, but the Malvern Hills area is mostly marked by dispersed settlement, with scattered farmsteads, hamlets and cottages (including isolated 12th/13th century moated sites). This pattern was established by the 14th century and intensified further with the disposal of the Crown estates in the 17th century (before this time, much of the Malvern Hills were royal hunting forests and settlement in this area had been very limited).

The position of many houses and farmsteads today relate to fields that have developed from the medieval period. Across much of the area, especially in the west, fields are generally irregular and small in scale, the result of medieval and post-medieval clearance from woodland. These fields are inter-mixed with surviving blocks of ancient semi-natural, replanted woodland and intakes from the hunting chase. Extensive areas of larger fields – particularly south of Mathon and Colwall - reflect the piecemeal enclosure of areas of open fields and common land in association with the development of medium-large scale farms. There are also large blocks of planned private enclosure which appeared during the 17th-19th centuries.
The area has a long history of arable cultivation in valleys, especially in the Cradley Brook Valley, but its soils were best suited to a pastoral economy including smallholding which was often combined with quarrying. Orchards developed to an intensive scale of production from the late 17th century, and are now scattered across the area. Formerly extensive orchards still survive in part, particularly in the Leigh and Alfrick area and around Colwall where fruit production for urban markets peaked in the early 20th century. The hop industry developed from the 18th century: hop fields were concentrated on the valley sides in the north.

(Traditional orchard)

The numerous springs around the hills were regarded as important places by the medieval period and became a focus of health-based leisure in the 19th century. This new popularity spurred the growth of Great Malvern and residential development in the surrounding area with villas and country houses becoming more widespread. More recently, some areas of distinct common-edge settlement, such as Wellington Heath, have been transformed by 20th century development.

4.2 The landscape today

There are 10 distinct landscape character types covering the AONB.

- The High Hills and Slopes are perhaps the most recognised landscape, characterised by exposed steep slopes with rough grazing and little human habitation. The iconic Malvern Springs and associated shrines are a feature here. Pathways and tracks are associated with Victorian Malvern when the area was a popular spa resort.

- The Principal Wooded Hills is a steep sloping, densely wooded landscape with small limestone quarries and irregular-shaped fields. These mainly represent the piecemeal clearance of woodland from the medieval period; settlement is sparse, comprising mainly scattered farmsteads linked by a network of lanes, tracks and paths. Dispersed settlement exists at Storridge Common in the north where piecemeal enclosure encroached onto the common and farms were possibly associated with a dual economy of farming and quarrying in the nearby quarries.
- The Wooded Hills and Farmland is a mixed farming landscape with large woodland blocks, irregular-shaped fields with thick hedgerows and settlement comprising farmsteads and small estate villages with clusters of settlement evident around old commons.

- The Sandstone Estatelands is low lying with estate villages, isolated farmsteads and clusters of wayside dwellings amongst large arable fields and ornamental parkland. There is a strong estate character in this landscape. Here country houses, associated large estate farms, plantations and planned gardens exist.

- The Principal Timbered Farmlands comprise small to medium-scale fields, many enclosed from woodland, ancient woodland and orchards. It is settled with clusters of farmsteads, rural dwellings, occasional small hamlets and villages. There are farmsteads, moated sites and wayside dwellings scattered throughout the landscape.

- The Forest Smallholdings and Dwellings landscape is characterised by winding lanes, small irregular-shaped fields and occasional historic, traditional orchards. It is densely settled with smallholdings and wayside cottages. Much 20th century development exists here and has altered the character of the distinct commons edge settlement at Wellington Heath.

- Settled Farmlands with Pastoral Land Use is a rolling lowland landscape with small to medium-scale fields and scattered farmsteads with linear clusters of dwellings, including common-edge settlement around the fringe of Castlemorton Common. This is a landscape with a domestic character defined by the density of settlement, grazed pastures, orchards and some arable fields.

- The Enclosed Commons comprises regular and straight fields of pastoral use with some arable farmland and isolated farms with clusters of wayside dwellings, all which have been subject to a higher degree of 20th century change than elsewhere in the AONB. The planned nature of this landscape, with straight roads and red brick farmsteads gives it a distinctly structured and human influenced character.

- The Unenclosed Commons is a wilder landscape with few field boundaries, rough grazing and sparse settlement with farmsteads along roads or as small islands within the commons.

- The Settled Farmland on River Terrace has a sparse settlement character of farmstead clusters and roadside dwellings. Intensive horticulture production with medium fields characterises the land use, commercial orchards are a dominant feature.
5. Landscape and setting

5.1 Landscape

Understanding the character of the landscape is essential to ensure any new building, extension or alteration is appropriate to its context and respects the natural beauty of the AONB. Responding to local landscape character and the special qualities of the site will ensure development is locally distinctive and appropriate to its setting: a building that is appropriate in one area of the AONB may not be appropriate in another area.

Issues to consider:

• Consider the landscape context of the site or building which is to be developed or altered and respond accordingly to ensure it becomes part of the landscape in which it is located.

• The relationship of building and landscape must be considered at various scales to understand how the building will affect views and landscape from both far away and nearby.

• Carefully consider the position of new development in relationship to key views.

• It is an important consideration to ensure a building ties into the local landscape and avoids detracting from key views.

• Consider orientating the building to take full advantage of the landscape setting, e.g. locate kitchens on the east where the sun rises, shelter outside seating areas from the prevailing wind or design asymmetrical buildings for steep slopes. See ‘Domestic buildings’ chapter for more information on orientation and aspect.

• New development should respect the grain of local plot size and density, the scale and form of fields and their boundaries, and the settlement pattern. Always use characteristic boundary features and styles.

• Avoid prominent and visually distracting lighting: respect the dark skies that are an important characteristic of the Malvern Hills AONB. (See ‘lighting’ section on page 58)
• Where locally characteristic, reinstate landscape features such as orchards, ponds and semi-natural habitats which reinforce landscape character and provide important wildlife habitats.
• Avoid upgrading unpaved routes to farms and cottages. These are often historic routes and essential landscape features: upgrading them can have a significant impact on views and how buildings ‘fit’ into the wider landscape. It also increases water run-off and can contribute to flooding.
• Leave areas of unmown grass close to buildings where doing so respects local character and provides habitat: this can help tie buildings into the wider landscape by preventing separation of the buildings from the wider landscape.

(The Malverns has been the focus of new architectural styles for over 200 years, from Georgian and Victorian villas to bold examples of modern architecture. This example sits in an area characterised by large houses set within large plots.)

5.2 Biodiversity

(Hedgerow around traditional orchard)

The biodiversity of the Malvern Hills AONB is closely related to the area's distinctive landscapes and their management. The AONB provides habitat for many species, some of which are of national importance. Careful consideration should be given to these species, but all biodiversity in the Malvern Hills AONB should be considered.

Issues to consider:
The protection and enhancement of biodiversity should be considered when first designing a new build, extension, alteration or conversion.

Survey the site to see what biodiversity exists, taking particular consideration of the species and habitats protected by law. Understanding the biodiversity of a site enables a development to enhance existing habitats and create appropriate new habitats where diversity is lacking.

Consider how gardens and areas surrounding the development can make a contribution to biodiversity, e.g. by integrating existing biodiversity into garden designs, planting native hedgerows and trees or creating ponds to provide habitats for insects, birds, mammals and amphibians.

Leaving areas of rough or unmanaged grassland provides habitat and breeding grounds for species such as butterflies.

Consider ways in which the sensitive design and planning of new buildings, extensions, alterations and conversions can enhance biodiversity. Opportunities include installing a green roof or walls, providing roosting sites for bats or nesting sites for birds.

5.3 Historic environment assets

Heritage assets are defined as ‘a building, monument, site, place or landscape identified as having a degree of significance meritng consideration in planning decisions because of its heritage interest’. Individual buildings and sites have different levels of significance, of importance in determining an application.

- Designated heritage assets include Scheduled Monuments, Listed Buildings (Grades I, II*, II), Registered Parks and Gardens, and Conservation Areas.
- Undesignated heritage assets of archaeological interest and of national significance, which are also treated as designated assets.
- Undesignated heritage assets of local significance, which can be identified on 'Local Heritage Lists' that are often supported by local planning policy. The effect of an application on the significance of a local heritage asset is a material consideration in determining an application. Buildings included on local lists of historic buildings and structures, although not meeting the English Heritage Principles of selection for national listing, are deemed locally significant and hence worthy of retention.
Details of designated heritage assets can be found on the National Heritage List for England. Guidance on the criteria, and how to apply for designation, can be found on the English Heritage website. (See links to resources)

5.4 Views

(View of the Malvern Hills from Mathon, showing the scales and prominence of buildings within the wooded landscape in the foreground and set against the backdrop of the hills.)

Views within the AONB and views from and towards the Malvern Hills are one of the distinguishing and valued characteristics of the area. The Malvern Hills AONB Partnership has produced guidance to help identify and grade important views and associated viewpoints in and around the AONB. Consider this guidance alongside that below.

Issues to consider:

- Consider how a building will look when viewed from short and long distances and from higher or lower ground.
- Consider the tradition of building in different areas of the AONB. Generally speaking, new buildings should not dominate views to and from unsettled areas.
- Where buildings are highly visible the design of all elevations on public view should be considered, not just the front of the building.
- Development should not distract from key views across the AONB but should complement and respect natural beauty and character. This is achieved through good siting of development, choice of materials, appropriate boundary treatment and scale, e.g. by ensuring new buildings are not considerably larger than existing locally characteristic buildings.
• Key views into and out of farmsteads and other existing buildings should be maintained or enhanced.

6. Domestic buildings

6.1 Existing building styles

Locally characteristic buildings are those which have been built using locally available materials or which follow the traditions used in the Malvern Hills AONB and surrounding region. A strong understanding of the locally characteristic architecture will help to inform future developments, alterations or extensions in the Malvern Hills AONB. The most common features of the Malvern Hills AONB are:

- Wayside dwellings, located on the roadside, or around commons and sometimes as small clusters. They are generally one or one and a half storeys, with one to two bays. These dwellings were constructed independently by their first residents using local materials, including late examples of scantling timber frames with stone or brick, or built entirely from brick and stone. They are usually highly individual buildings, each with a distinctive character.

  (Wayside cottages)

- Timber framed houses and cottages include cruck-framed houses, which are concentrated in the medieval enclosed landscapes such as the Suckley Hills to the north. Other examples include farmhouses no longer in agricultural use which have lost their working buildings, and squatters’ cottages. Timber framed buildings are more common in the wooded landscapes due to the availability of local timber. The timber frames were infilled with wattle and daub and later brick. Timber framed houses in the AONB generally date from the 17th and early 18th centuries, although some are earlier. Since the 18th century they have been considerably extended in some areas, using red brick and local stone.

  (Fine 17th century 2-room house with large end stack)
• Quarrymen’s cottages were built during the 19th century, using local stone. Examples are usually found in areas of the AONB close to the quarries themselves, such as West Malvern and around Hollybush.

• Large estates developed in the 18th and 19th centuries, e.g. Eastnor Castle and its landscape which was laid out in the early 19th century. Houses in these landscapes are influenced by estate management and sometimes characterised by traditional estate colours. They often include decorative elements such as ridge tiles and bargeboards.

• Victorian architecture, notably in the more settled areas of the AONB such as West Malvern, Malvern Wells and Colwall. Victorian houses are generally built from traditional brick or stone and are taller than older buildings. They usually include more decorative elements such as moulded cornices and architraves.

• Rural villas often set in their own designed landscapes, amongst mixed ornamental woodland. They range from symmetrical houses in the Late Georgian style to more asymmetrical Gothic Revival houses using local stone, and progress into the distinctive Arts and Crafts architecture of around 1900 to the 1930s. They are much more decorative than other residential buildings, often
including segmental and pointed arches above openings, ashlar or brick quoins and dressings on stone buildings, large stone-mullioned windows, crested ridges, finials and decorative bargeboards. The Malvern Hills AONB is one of the best places in England to observe the development of the rural villa.

(Gothic Villa)

(Less common in the AONB - a classic 3-bay villa in Late Georgian style, rendered with classical porch and deep eaves to hipped roof)

- Edwardian houses feature in the settled areas of the AONB. These are generally semi-detached and can include mock Tudor gables, bay windows and pebble dash.

6.2 New domestic development

New development is any proposed new building in the Malvern Hills AONB. It includes anything from a single dwelling to a large development of many units. The following provides a guide for new development to ensure it responds to the local landscape and has a distinct identity.

6.2.1 Siting and density

Care should be taken to ensure new development does not damage a settlement’s character and that the density of the new development reflects the existing settlement pattern. General guidelines which will normally help to ensure this are outlined below.

Issues to consider:

- It is usually appropriate to site residential development of more than two units within existing towns and villages. However, some towns and villages may only be able to accommodate limited new development in order to prevent the effect of urban sprawl and coalescence of settlement.
In a clustered settlement pattern, where there is largely unsettled land between clusters of modest-scale dwellings and other buildings, it may be acceptable to build one or two houses close to existing buildings. Such development must respect the inherited pattern of plot size and building scale.

(Large cluster of buildings set within their own grounds)

Larger groups of buildings within an area of dispersed settlement, such as the Principal Wooded Hills, are likely to damage the settlement character of isolated or clustered buildings. Whilst high density developments would be inappropriate, one or two isolated dwellings may be acceptable.

(Clusters of buildings are uncharacteristic in a dispersed settlement pattern)

In some cases, where the landscape is sparsely settled, it may be more appropriate to alter, extend or replace an existing building than to introduce additional buildings into the landscape.

The local pattern of spacing between buildings and roads should be respected. For example, in areas where cottages are set back from the road new buildings should continue this character and not be sited directly onto the roadside.

6.2.2 Aspect and orientation

The orientation of the building is its position in relation to the points on a compass and where the building is located on site. The aspect refers to the particular direction which a slope faces.

Issues to consider:
• Considering aspect and orientation will ensure the building responds to its landscape context. This includes considering the direction of the prevailing wind (consider this also when siting outdoor seating areas), the location of neighbouring buildings, surrounding trees and how these will affect light, shade or privacy.

• Consider the path of the sun throughout the year. This will affect internal light, heat and glare. For example, siting large areas of glazing on southern aspects will maximise passive solar gain, reducing heat energy needs. Carefully consider the impact of glare from glazing on views from the surrounding area.

• Consider the location of existing routes, such as public rights of way or roads, and access points, to ensure that the new development does not affect access for others and to provide privacy and security for the new development.

6.2.3 Building style

Within the AONB the characteristic building style often varies between each landscape character type, for example, rural villas are characteristic in West Malvern and Malvern Wells and simple timber framed cottages are characteristic in the Principal Wooded Hills. A strong understanding of existing characteristic buildings, which contribute to the local character within the landscape character type where the new development is located, is essential to ensure that the style of new development is appropriate. For example, a new building inspired by the rural villas in West Malvern would not be appropriate in the Principal Wooded Hills.

Issues to consider:

• New development should have an appropriate identity that makes a positive contribution to local distinctiveness.

  (New locally responsive development in Longley Green)

• Innovative designs can integrate the needs of sustainability, energy use and respect for landscape character.

• Explore the potential for new buildings to creatively reflect features on locally characteristic buildings within the relevant landscape character type such as exterior chimneys, steeply pitched roofs, ornamentation or a mix of materials where they are characteristic locally.
• Have regard to local building character. For example, where there is a history of designing and building with an individual character in an area it is likely to be appropriate to continue in this tradition.

• Consider the roof shape and style of existing locally characteristic buildings. It is generally more appropriate for roofs to be simple with uncomplicated shapes. However, in some areas complex rooflines are characteristic and these should be reflected in new development.

• Planting should be used, where appropriate, to help assimilate buildings into the landscape, but it should not be used to screen poor development. Good building design is always essential.

6.2.4 Scale, mass and form

Scale, mass and form are generally interlinked. The scale of a building refers to its height, length and width. The mass is its overall shape and size, taking into account the building scale and volume. The form is generally considered to be the 3D outline of the building including the floor plan and shape.
(View of street scene in Malvern Wells shows a consistent scale, mass and form of buildings, although there is variety in terms of colour and details)

Issues to consider:

• New development should respect the scale, mass and form of the existing locally characteristic buildings within the landscape character type where the development is located to avoid eroding local identity.

• Developing larger buildings will be most appropriate in areas where such buildings are characteristic, for example in West Malvern or Malvern Wells where Victorian villas are common.

• It is unlikely to be appropriate to build a house with a large and complex shape in proximity to simple, rectangular form dwellings, especially where such buildings are characteristic, for example on Castlemorton Common.
Where larger scale buildings do exist, new development should be informed by an understanding of their historic form, which can range from symmetrical and formal to informal compositions with varied projections and rooflines. New development should respect the scale and simplicity of smaller-scale buildings where these are common, avoiding elements such as projections and bay windows which may diverge from this local character.

Where it is necessary for a new building to be taller than surrounding buildings, sensitively design the new building to minimise its impact. For example, through the use of set back and projecting sections where appropriately characteristic, and by taking advantage of height changes in topography.

6.3 Alterations and conversions

Alterations and conversions are the improvement or renovation of existing buildings and are nearly always preferable to new development because re-use/renovation is usually more sustainable in terms of retaining embodied energy, resource use and cost. Alterations and conversions include reconfiguring the building inside, changing its use to enable a new lease of life, or enhancing the character of a building and removing historical changes which have harmed character or weakened visual unity. It may be appropriate to make a record of a historic building’s character, features and layout before altering or converting it to ensure future changes are informed by the original character. English Heritage provides guidance regarding this. (See links to resources)
Issues to consider:

- Alterations or conversions should respect the architectural integrity, character and scale of the building. For example, where a building is characterised by a simple, non-decorative design, this should be retained.
- Consider opportunities to reinstate historic character. This could include replacing uPVC window frames with wooden frames or introducing elements of locally characteristic materials or design where appropriate.
- In some circumstances, for example where materials are to be replaced or when closing or creating an opening, it is appropriate to closely match the manufacturing, colour, size and texture of materials on the original building rather than use contrasting materials. It may be possible to find reclaimed materials locally which provide a match.
- The cleaning of older brick and stone buildings is generally inappropriate because this will lead to a loss of both patina and lichen, and may cause damage to the materials.
- Re-pointing on a large scale should generally be avoided as this will fundamentally affect the character of the building. Confine re-pointing to localised areas requiring repair and use traditional methods where appropriate.
- Natural building materials, which are found locally and are not man-made, should be used wherever possible on buildings where they are part of the building character, especially if the building is listed or in a conservation area.
- Where decorative details need to be replaced or where new openings are added, the decorative details should normally copy those on the original building to ensure continuity between openings and maintain the unity of the building.
- Avoid creating new detailing or decoration on simple buildings where it would traditionally not have existed.
- Historically or architecturally important features such as arches, lintels, ventilation slits and fixed machinery related to, or forming an important intrinsic part of, the building’s original use should be retained in situ and integrated with the proposed alterations or conversion.

6.4 Extensions

Well-designed extensions can revitalise older buildings and contribute positively to local character. If done badly, extensions detract from the original building and can impact on the wider local
landscape. It is essential to ensure an extension has strong unity and a relationship to the original building; strengthening character rather than weakening it. This does not mean that extensions should copy existing development: a sensitive and good modern design can complement the original building and respect local character.

(Simple rendered modern extension to the rear, with ridge set beneath earlier ridge line)

6.4.1 Scale, mass and form

The scale, mass and form of an extension should be determined by the character, scale, mass and form of the original building. Extensions are dependent on the original building. There may be some buildings which cannot easily accommodate an extension or will require very sensitive design and planning. On some buildings it may be that any extension is inappropriate.

Issues to consider:

- The general size, height and width of the extension should normally be less than the original building, ensuring it remains subordinate to the original building in terms of scale and form. This can be achieved by:
  - Setting the extension back from the main elevation building line to make it less imposing and reduce its impact on the main building
  - Setting the eaves and ridge of the extension lower than those of the original building: normally a 0.5 metre set down would help to reduce the impact of the extension.
  - The length of a side extension normally being not more than the length of the front elevation of the original building.

(Extension is not longer than original building, is set back from the building line and set down below the original ridge so it does not dominate original building)
• The cumulative effect of previous extensions to the original building should be considered. The effect of several extensions from different periods can erode the character of the original building. It may not be appropriate to enlarge the building further, but instead to rework existing extensions more sympathetically or appropriately.

• Consider where to locate an extension. A rear extension can limit the impact on the original building when the building faces onto a road or public right of way. A side extension can be appropriate where space for a rear extension is limited or a rear extension would be highly visible e.g. from a viewpoint.

• Occasionally, and where space allows, it may be most appropriate to build a separate building which is connected to the main building by a link. This can help maintain the form of the existing building.

6.4.2 Building style

The style of extension will very much depend on the character of the original building. Some buildings may be able to accommodate extensions which are clearly different whilst it would be preferable for others to closely match the original building. Design should be rooted in a strong understanding of the building’s character and the landscape context.

Issues to consider:

• Consider the appropriate building methods, colours and architectural styles for the extension. These can be traditional or contemporary as long as they complement the original building and local character.

• Generally, it may be most appropriate for extensions on significant or notable buildings to be clearly different to the original building. This will allow the merits of the original to clearly stand out. However such a decision should always be based on an understanding of the building’s character.

• When using materials which do not match those on the original building they should not detract from the original building in terms of colour and details.

• The roof style and pitch of an extension should normally reflect the original roof: for example where the original building has a hipped roof, the extension should also have a hipped roof.
The roof pitch and materials of this extension reflect that of the original building.

Extension to this building in Mathon has used closely matching materials.

- Decorative detailing on the original building should be reflected, not necessarily copied. Fewer details on the extension will help make it subordinate to the original building.
- Ensure characteristic features such as large exterior chimneys are maintained.

Location of extension has retained the large exterior chimney.
6.5 Conservatories

A conservatory is often considered as an alternative to an extension. The guidance on extensions may therefore provide additional help to that below.

Issues to consider:

- Conservatories should respect the style of the original building and not dominate. For example, if appropriate, a conservatory on a simple traditional cottage should be simple with few details. More ornate conservatories might be appropriate on decorative buildings, such as Victorian villas.

- The height of a conservatory should be carefully considered to ensure it does not dominate the original building. On a two storey building the conservatory should normally be no higher than the underside of first floor sills of the original building. On a bungalow, the height of the conservatory should normally be lower than the eaves of the original building.

- It is usually preferable to locate conservatories on the rear of the house.

- Timber or steel are the most appropriate materials for conservatory frames. (See ‘Materials’ chapter for reasons not to use UPVC)
6.6 Porches

There are a variety of porch styles, usually external to the main building to allow space to pause before entering or exiting a dwelling.

Issues to consider:

- Consider the appropriateness of installing a porch: in some cases, where the original building is a simple design, an external porch or porch hood could detract from this simplicity. In others, a porch could detract from a characteristic doorway. An internal porch (vestibule) may therefore provide a suitable alternative.

- Where they are considered appropriate, porches and porch hoods should not appear to dominate the original building in terms of size: as a general rule, they should normally not be any larger than required to surround the door opening itself and normally be no higher than the first floor sills of the original building.

- They should be suitable for the property and well-designed: a decorative porch would not be appropriate on a simple traditional building.
(Porches on these dwellings are proportionate. Simple materials and colours complement the original buildings)
7. Farmsteads and agricultural buildings

A farmstead comprises a farmhouse and the working buildings of a farm. Some farms also have additional field barns or outfarms sited away from the farmstead. Significant traditional farmsteads and their buildings contribute to the local character and distinctiveness of the Malvern Hills AONB and have one or more of the following:

- Traditional farm buildings with a locally distinctive architectural form and character, constructed using local building materials.
- Traditional groups, where the historic buildings and spaces relate to each other.
- Legible settings, existing as part of the landscapes and settlements within which they developed.

(Farmstead including farmhouse and barns)

(Shelter shed for cattle in the Sandstone Estateland)

(White House Farm)
Traditional buildings display enormous variation in their plan form, use of materials and the way they have developed as part of the farmed landscape. Traditional buildings are not the prefabricated and standardised industrial buildings used today. These buildings display no local variation in character or distribution but are essential to the modern farming industry. Future change is inevitable if historic farmsteads are to remain as a distinctive part of the Malvern landscape. Where it is fully informed, new uses for historic farm buildings can make a positive contribution to landscape character. They can inspire appropriate, high quality new development, and sustain the distinctive character and significance of historic farmsteads in the landscape.

Understanding of farmsteads in the Malverns has benefitted from the West Midlands Farmsteads and Landscapes Project conducted by English Heritage in collaboration with local, county and metropolitan authorities (See links to resources). The headline results of this study show that:

- Historic farmsteads, comprising the farmhouse and most or all of the working buildings, are assets which make a significant and highly varied contribution to the rural building stock, landscape character and local distinctiveness of the West Midlands. The Malverns has a high rate of farmstead survival except around Malvern (7% loss), with 72% of farmsteads (West Midlands average 40%) recorded from late 19th century maps retaining more than half of their historic footprint.

- Through agricultural, and other new uses, historic farmsteads make an important contribution to the rural economy. A third of these farmsteads in the West Midlands (only 21% in the Malverns) remain in agricultural use with varying degrees of diversification. Only 5% have been converted to sole industrial, commercial or retail use. Over two thirds of farmsteads, are in residential use, including those where some or all of the working buildings have been converted into housing.

- The economic significance of residential use can be easily overlooked but residential and economic use are often interlinked. The study found that one in twelve of farmsteads in residential use are also the registered office of a limited company – this measure serving as a proxy of home-based professional working. They also provide homes for a ‘business elite’, with 22 directorships of substantial firms for every 100 farmsteads far outstripping the national average. Regardless of location, historic farmsteads are more often used for a diversity of home-based entrepreneurial businesses than any other dwellings. This is particularly the case in the Malverns, where three farmsteads out of four are in residential use with their occupants showing high participation in substantial business at director level (39 directorships per hundred farmsteads).

Malverns farmsteads include a variety of building types, the largest and most distinctive being threshing barns for storing and processing the harvested corn, and hop kilns for the drying and storage of hops. Granaries, stables and cider houses, often combined into multi-functional ranges, and housing for cattle are also typical. Farmsteads are smaller and more numerous in the Suckley Hills to the north and larger in the estate lands to the south.

The key farmstead plan types in the Malvern Hills AONB are:

- Loose courtyard farmsteads, mostly small in scale, with detached working buildings to one or two sides of the yard.
• Small-scale regular L-shaped farmsteads, mostly comprising simply a barn with additional shelter shed but some with additional working buildings to 3 or 4 sides of the yard.
• Some medium-large scale regular courtyard farmsteads, mostly U-shaped and including some multi-yard plans.
• Concentrations of linear farmsteads where the house and working buildings are attached and in-line in areas of smallholdings (e.g. Storridge Common). By the later 19th century many of these had been absorbed into larger farms and are now very rare.

These have all developed within their farmed landscapes (see summary in Landscape and Setting), including as illustrated below:

- On the edges of settlements where fields were enclosed from medieval strips and may retain their curved profiles.
- Within blocks of enclosed land intermixed with open commons.
- Large farmsteads within fields that have been enlarged and reorganised over time.
(Images show examples of farmstead plan types typical of the AONB in their landscape context)

(Shows linear and L-Plan farmsteads (small to medium in character) associated with piecemeal enclosure of the landscape, in Alfrick Pound)

(Shows smallholdings in a common edge context around Castlemorton Common)

(Shows an example of a lager Regular Courtyard farm associated with mixed farming in a planned landscape)
7.1 Understanding the Farmstead

Development or change to farm buildings should be based on understanding the entire farmstead and its relationship to the landscape. This understanding should be developed before any design or planning for change commences. Change should seek to reinforce and strengthen the relationship of the farmstead with the landscape and the agricultural character of buildings.

Issues to consider:

- Assess the significance of the farmstead in the landscape: views into and out of the farmstead mean it plays a role in the context of the local landscape. These views should be considered during development or changes to the farmstead. New buildings should not block these views.

- Understand the relationship of different buildings to each other. By noting how different buildings relate to each other it is possible to observe past changes – the loss and addition of buildings – and the hierarchy of buildings. This informs redevelopment by identifying where there are spaces and opportunities for new buildings or alterations which reinforce the character of the farmstead. It also informs the use of materials, colours, scale, massing and design.

- Consider the spaces and gaps between buildings (the yards and routeways), and how these relate to the group of buildings and wider landscape, when choosing the location and character of new development.

- Maintain the functional, rural and working character of farmsteads to uphold their agricultural character in the landscape and their contribution to the Malvern Hills AONB.

- Record the character of buildings before changes occur to ensure that future work can be informed by historical character and not by redevelopment works. It is important to record and retain historical features internally and externally such as doors and windows, open interiors, roof trusses, and floor surfaces and structures. These important elements compose the character of the building.

7.2 Introducing new development to historic farmsteads

Consider the capacity for change of farmsteads through the introduction of new buildings at the earliest critical stage in the planning process, by understanding and identifying the following about the farmstead:

- Their character, which results from their historic development and function as whole sites, including any routeways and spaces within and around them, and how they are linked to the surrounding landscape and settlement.

- Their significance, a factor that can be of critical importance in determining planning applications.

- Their sensitivity to the changes being considered, and other issues that can inform pre-application discussion and be taken forward when preparing a scheme.
7.2.1 Proposed buildings

There may be opportunities for new buildings (ancillary buildings and dwellings). Such buildings may be considered as enabling development to help significant buildings that are highly sensitive to adaptive reuse, to be retained and reused. 3

Such development might include the demolition of modern shed buildings or buildings insignificant to the character of the farmstead or the opening of spaces to better reveal the significance of heritage assets, enhancing the contribution that farmsteads make to surrounding settlement and landscape. Getting the design right is essential on such sensitive sites and so gaining a detailed understanding of the landscape, the farmstead and its buildings is critical to achieving successful design in the rural context.

Issues to consider

• Consider the potential to reinstate missing elements that may maintain or enhance the character and significance of the group. This does not mean replicating lost buildings but using an understanding of farmstead character to inform new design. Different opportunities or constraints may be offered by the plan form and the level of change.

• Whether the introduction of a new building could secure the future of highly significant buildings, or other traditional buildings, within the group that have low potential for change.

• The use of materials of appropriate quality is essential in ensuring a successful scheme. Consider the cost and availability of traditional building materials and the potential for salvage of materials although the source of these must be considered.

• The siting of shelterbelts to protect and mitigate against the effects of cold winds in landscapes where shelterbelts are a characteristic feature (see local guidance for more detail).

• Careful consideration of site layout, building design and materials to help minimise fuel costs and reduce carbon emissions at source.

• South-facing frontages with the longest face within 30 degrees of south – ideally facing south-east – can often be achieved, as many historic farmsteads tended to face south to maximise the sun.

• Potential of the site for micro-generation, combining available technologies.

• Potential and appropriateness to deliver building-integrated and free-standing technologies including solar, wind and water power, use of biomass crops, geo-thermal sources and air-source heating and cooling.

---

3 Enabling development is development that would be unacceptable in planning terms but for the fact that it would bring public benefits sufficient to justify it being carried out, and which could not otherwise be achieved. English Heritage has produced guidance on this at http://www.english-heritage.org.uk/publications/enabling-development-and-the-conservation-of-significant-places
When planning new development within farmsteads it is important to consider where new buildings can fit in relation to the different farmstead plan types which exist within the Malvern Hills AONB. Information about the different plan types in the Malvern Hills AONB can be found below.

### 7.2.2 L Plan yards

L Plan yards tend to be smaller scale than other farmstead plan types and well-defined in terms of form. The strong sense of definition makes this plan type very sensitive to change.

**Issues to consider:**
- Further buildings should only be introduced where they do not alter the original plan form or impact upon the courtyard.

*(Historic L Plan farmstead) (An example of positive change where a detached building (shown in green) could be added with inward facing openings, thus, mitigating the impact)*

### 7.2.3 Regular courtyard plans

Regular courtyard plans vary in terms of the number of sides they have. There is sometimes space for further development if it is sensitive to the scale of existing buildings and spaces between these.

**Issues to consider:**
- Consider the courtyard itself: new development should respect and maintain this space.
- Where regular courtyard plan types exist, new development should maintain the form, be it U plan or F plan.
- New development should avoid repetition of the traditional plan form: if there is already a U plan farmstead, avoid creating a second U plan when a new courtyard is necessary.
7.2.4 Loose courtyard plans

Loose courtyard plans are often simple in form and tend to be characterised by buildings which are separate from each other. They can be as minimal as a farmhouse with one barn to the side or they can be more complex with buildings on all three sides of the yard.

Issues to consider:

- In the case of loose courtyards with one working building, there is unlikely to be opportunity for new development other than extensions to the existing building or small additional buildings.
- Where there are working buildings on more than one side of the yard there may be opportunities for new development that respects the loose and informal character of the group.
7.2.5 Dispersed farmsteads
Dispersed cluster farmsteads are marked by the informality of the grouping.

Issues to consider:
- Retain the dispersed and informal character of the building groups, and avoid layouts which formalise the grouping.

7.2.6 Multiyard farmsteads
Multiyard farmsteads comprise grouped buildings around a series of yards: they can be dispersed or regular in their overall form.

Issues to consider:
- When adding new buildings it is essential that the size and location of buildings is sympathetic and appropriate to the existing plan.
- This plan type can enable more scope for more building variation, in terms of materials and character, than other plan types but its character should be respected and maintained.

7.3 Alterations, conversions and extensions of existing farm buildings
As the economic vitality of agriculture has declined and as farming practices have changed so has the demand for working farm buildings. Consequently, some are being converted to new uses, such as a residential use. This reflects our ability to revitalise and re-use buildings to suit new needs whilst maintaining them as valuable elements within the landscape.

(Agricultural building now restored and in office use)

Issues to consider:
- The separate characters of domestic and working buildings should be retained. Working buildings have a more simple form and fewer openings (particularly windows, although there may be ventilation holes).
• Where extensions, alterations or conversions are considered, the agricultural character should be retained. Decorative elements should not be introduced; these erode the functional and simple character of buildings whilst introducing suburbanising or residential elements.

(Reuse of agricultural buildings)    (Sensitive barn conversion, retaining decorative ventilation panels)

• Drains and gutters should be dark, discrete and minimal, unless the traditional colours associated with the Estates are locally characteristic.

(Converted agricultural building)

(New windows in barn conversions are not in-keeping with their agricultural character)

• When converting buildings there is often demand to increase openings to allow natural light inside. It is generally preferable to avoid creating new openings and to work with the existing openings. Careful internal planning and design can enable the introduction and borrowing of natural light.

• Where new openings are essential, avoid prominent elevations and place them on the least sensitive elevation in terms of the character of the farm building.
The use of rooflights should be minimal and positioned on the least sensitive roof slopes in terms of views to the farmstead. Steel farmed rooflights set flush to the plane of the roof are usually most appropriate.

Alterations and extensions may use new materials which are of a suitably good quality to ensure durability and sustainability: traditional materials are preferable but their cost and availability may be an issue.

Where new materials are introduced to a historic farm building they should match or, if this is not possible, complement existing materials in colour, size and shape. The use of contrasting materials will generally be inappropriate.

When converting farm buildings, particularly to residential use, private areas such as gardens need to be carefully sited and contained, particularly in relation to public views and the surrounding landscape, to prevent the introduction of residential or suburbanising features in the landscape and to ensure privacy.

There is often no hard boundary definition between farm buildings and the landscape: where this is the case new buildings and extensions should follow this characteristic.
7.4 New agricultural buildings

There is an economic need for new agricultural developments as a result of modern farming practices and the selling of traditional farm buildings for conversions. Modern farm buildings tend to be larger than traditional farm buildings and increasingly there is demand for buildings on previously undeveloped land. New agricultural buildings can have a significant impact on the landscape because they may be permitted in wider countryside areas where other types of development would not be. New farm buildings need to be fit for function whilst reflecting local building practices and contributing to landscape character. When located near existing farmsteads they must not dominate the existing farmstead; respect for the existing farmstead plan type must always be maintained.

7.4.1 Building style, scale and massing

When planning new developments it is important to consider the scale and massing of existing agricultural buildings, ensuring that new buildings reflect these. Buildings out of scale with other farm buildings in a group will dominate the group, eroding its contribution to landscape character. The following guidelines provide advice on how to ensure a building fits with the landscape, minimising impact and maximising contribution to character.

Issues to consider:

- The visual impact of a larger building can be limited by the use of a series of shorter span portal frames to reduce elevations and create a lower roof height than a single span roof.
- It may be possible to construct two smaller buildings rather than one large building, particularly where topography is steeply sloping and there is limited space for development.
- The scale and mass of larger buildings can be broken up by setting back or projecting some sections of the building or by stepping the roofline.
- Overhanging eaves create a shadow line making buildings appear smaller than they are.
- When building on sloping ground, build on lower rather than higher slopes, and on a break in slope: this reduces visual impacts and the need for earth movements and alterations in land form.
- Where possible, ensure a backdrop of mature trees or hills to reduce the visual impact of the building. Although emphasis should remain on good siting and design rather than screening and mitigation measures to alleviate impacts.
• When buildings are intended to house livestock 10% of the roof space should be made up of roof lights or openings to enable sufficient natural light penetration. Roof lights should be evenly distributed across the roof, and located on the least visually prominent roof slope.

7.4.2 Materials and colour

The use of appropriate materials and colour makes a major contribution to ensuring an agricultural building fits into the landscape. The following guidelines relate specifically to appropriate materials and colours for farm buildings in the Malvern Hills AONB. General guidance in the ‘Materials’ chapter should also be considered.

Issues to consider:

• Traditional materials such as stone and traditional brick are characteristic in the landscape. They are durable and help to ensure a development is sustainable in the long term as well as being characteristic of the local area. Where the use of traditional materials is not economic then it is important to ensure the new materials used are appropriate for the local landscape.

• Use non-reflective materials or matt paints to reduce the visual impact of agricultural buildings in the landscape. Colours should reflect the colour of materials on surrounding stone or brick agricultural buildings, (generally warm but muted, earthy tones) and should not stand out in the surrounding landscape. Although farmhouses are sometimes painted white it is generally not appropriate to paint agricultural buildings white.

• On new agricultural buildings, the use of many materials or colours on one building has a negative visual impact, affecting the unity of the building. Similarly, the use of one type of material or colour creates the illusion of a larger building: a mix of two or three different materials and complementary colours is preferable with darker shades on lower courses.

• New agricultural buildings often comprise two different courses – a lower course and an upper course. If the lower course comprises concrete blocks these can be rendered or painted an appropriate colour to blend with surrounding buildings (generally warm, muted and earthy tones).

• Pre-cast concrete constructions can be dyed an appropriate colour to match stone on surrounding buildings.

• When different materials are used on the same building they should not be evenly proportioned: using different proportions of colours and materials will further reduce the apparent size of buildings in the landscape.

• Darker colours on roofs than on walls make a building look smaller. Dark roofs however may increase heat absorption and would require additional ventilation for livestock housing. An exception to this is if a building is to be located against a skyline, it would then be more appropriate to use a lighter colour for roofing which would blend more with the colour of the sky.

• Timber boarding provides excellent natural ventilation for new agricultural buildings. It may be possible to source this locally. More information about using timber can be found on page 65.
7.4.3 Temporary accommodation for seasonal workers

Although temporary, accommodation for seasonal workers can have a significant impact on the landscape.

Issues to consider:

- The visual impact should be reduced by designing and siting the building using the principles for new agricultural buildings above. For example, siting the structure on lower slopes with a backdrop of trees and using muted, non-reflective materials and colours, and siting away from important views.

7.5 Links to ‘farmstead and agricultural building’ resources:

- Understanding of farmsteads in the Malverns has benefitted from the West Midlands Farmsteads and Landscapes Project which was conducted by English Heritage in collaboration with local, county and metropolitan authorities. [www.english-heritage.org.uk/wmidlandsfarmsteads](http://www.english-heritage.org.uk/wmidlandsfarmsteads)

- Helm also provide advice of farm buildings. [www.helm.org.uk/farmbuildings](http://www.helm.org.uk/farmbuildings)
8. Gardens and boundaries

Good design of the external areas surrounding a building, including gardens, boundaries and car parking, is critically important in complementing and enhancing the building. It is crucial to integrating a building into the surrounding landscape. Consider what is characteristic locally when designing the areas around a building: creating a garden or boundary which is not characteristic will be at odds with the surrounding landscape and create a negative impact for the building. Car parking should not dominate as this will have a negative effect on the natural beauty of the Malvern Hills AONB.

8.1 Gardens

Buildings in the AONB are often set back from roads in their own grounds. In some areas of the AONB, however, there are no front gardens and buildings front directly onto the roads.

Issues to consider:

- Where characteristic, set buildings in their own grounds, with front, side and rear gardens.
- Avoid extending gardens onto farmland/ the wider countryside: this creates inappropriate textures and colours in the landscape and urbanises/ suburbanises the landscape character.
- Plant native and/or locally characteristic species to help tie development into the local landscape and enhance biodiversity. Planting native thorny species such as blackthorn, hawthorn and holly can provide a secure boundary and deterrent to intruders.
- Keep hard surfacing to a minimum: avoid formal kerbs, tarmac and paving, particularly in the wider countryside or on the edges of settlement.
- Use materials, such as loose gravel or crushed stone, from a local source, in a colour complementary to the surrounding soil colour. This reduces visual impact whilst helping prevent flooding as part of a sustainable drainage system.
- Creative design of outside space should minimise potential hiding places or opportunities to access upper floors.
8.2 Boundaries

A variety of characteristic boundaries exist in different parts of the AONB including: stone or brick walls in settled areas; and native mixed species or thorn hedgerows in open countryside. In some areas of the AONB there is no boundary definition between buildings and the surrounding area.

Issues to consider:

• Avoid the removal of characteristic boundaries, especially where they play an essential role in the enclosure pattern of the landscape.

• For new boundaries, observe and follow characteristic local boundaries:
  ▪ Where hedgerows are dominant, new hedgerow boundaries should be planted using locally occurring species. See also the local guidance section of this document.
• The style of Malvern stone wall construction and the mortaring technique used can change on a very local scale. Follow the local style, including the size and shapes of stone blocks, the bond pattern and mortaring technique:
  • Malvern stone walls can have alternate large and small coping stones known as ‘cocks and hens’: where this occurs locally, it should be followed.
  • When repairing or constructing walls with Malvern stone traditional lime mortaring is normally locally characteristic. This is generally more durable, breathable and flexible than modern cement.
  • Pointing on Malvern stone walls should follow the traditional style of lime mortar, flush with the wall and therefore subtle in appearance.
  • Older Malvern stone walls sometimes have snake/ribbon pointing. This style of pointing is sometimes associated with Victorian gothic and domestic revival properties. Maintaining such pointing may be appropriate when associated with such properties.

(Snake/ribbon pointing on Malvern stone wall)  (Malvern stone with soft mortar)

• Malvern stone can be used as a facing to a wall constructed in another material.
  • If this is not possible, a brick wall, using a mix of red or blue brick, with detailing of Malvern stone, and lighter coping stones may be acceptable.

(Malvern stone facing a breeze block wall)

• Fencing is not generally characteristic in the landscape and would usually be inappropriate where native hedgerows or stone walls are the characteristic boundary. Occasionally, fencing may be acceptable if it is low, avoids uniformity and does not erode the local character through inappropriate colours or the introduction of suburbanising characteristics.
Low, timber gates are preferred, particularly to modest, rural dwellings. Metal or large gates may be appropriate in certain locations, for example, low metal gates at entrances to agricultural land/buildings, or larger, ornate gates to large properties.

8.3 Sheds, garages and other outbuildings

Ancillary buildings, such as sheds, garages and outbuildings, are often necessary additions to a development, providing useful extra space for storage, car parking or domestic activities which can clutter the landscape. The following guidelines aim to ensure they do not impact negatively upon the design and character of the building which they are linked to.
Issues to consider:

- Sheds, garages and other outbuildings should not compete, in terms of scale, decoration and design, with the original buildings they serve. They should be designed and sited to relate to, and not dominate, the original building. Use of more subdued colours and simple designs will allow them to be less obtrusive. Some decoration may be appropriate if this helps reflect the character of the main building.

- Materials should aim to complement those on the original building, either by closely matching or using different materials which are complementary in terms of colour, texture and size. Materials and colours should respect those of the local landscape.

- The roof pitch should normally be similar to the original building.
• Where a garage adjoins the original building, the guidelines for extensions should be followed.
• For security purposes, site sheds where there would be surveillance from buildings, roads or footpaths, but where this would not impact on landscape character or key views.
• Careful consideration should be given to the siting of elements which can become permanent and detract from the character of the area such as dustbin areas and garden furniture. Screening with appropriate planting or using appropriate outbuildings, sited and designed in order to fit into the local landscape can help.

8.4 Car parking

Spaces located near to a development to park cars tend to be associated with most new developments or redevelopments. Their impact on the setting of the building and the wider countryside should be minimised to avoid impacting on landscape character.

Issues to consider:
• New large car parks are unlikely to be acceptable in the AONB.
• Site car parking away from key views and integrate it into the landscape through the use of tree planting, appropriate boundary treatment and surfacing (crushed or loose stones and gravel).
• Avoid formal drives which are edged and surfaced particularly in the open countryside, unless they are locally characteristic.
• For security, site car parking where there would be surveillance from other buildings, roads or footpaths, but where this would not impact on landscape character, key views or people’s privacy.
• Underground car parking may be appropriate with apartments and large-scale developments in settlements where ancillary space is limited.
9. Lighting

The dark skies of the Malvern Hills AONB are a key component of its natural beauty, making an important contribution to the sense of tranquillity and the rural character of the landscape. External lighting such as street lighting, security lights and flood lighting contribute to light pollution and can have a negative impact on the rural landscape and on tranquillity. Outdoor lighting can also negatively affect bats, moths and other nocturnal animals.

Issues to consider:

- External lighting should only be installed where necessary and should be kept to an absolute minimum. New external lighting may be unacceptable in dark sky areas where it could have a significant impact on current levels of tranquillity. Any lighting considered to be essential, including street lamps, should be switched off at night.
- Lighting should be kept low to the ground wherever possible.
- Permanently lit outside lights are unlikely to be acceptable. Consider the use of motion sensors so that lights are only on when necessary, e.g. when approaching the front door.
- Use low level wattage bulbs. A 150 watt outside security light is recommended, rather than the more powerful 300 to 500 watt lights.
- Angle external lighting downwards to avoid illuminating neighbouring buildings.
- Fit hoods or shields to external lights to minimise light spillage.
- On commercial buildings, if illumination of signs is required, these should be lit from above, not below.

(Example of down lighting showing minimum light spillage)

Links to ‘lighting’ resources:

10. Shop fronts and signage

Malvern Hills District Council and Herefordshire Council have developed guidance for creating or altering a shop front or signage. This should be used alongside the general points below.

10.1 Shop fronts

Generally shops in the Malvern Hills AONB are found in the settlements, such as Malvern Wells and Colwall. They mostly consist of post offices, restaurants and independent retail units. Historically, many shop fronts in the AONB have been installed onto the front of an existing residential building, mostly Victorian villas or cottages. Some shop fronts from the 19th century survive today.

Issues to consider:

- It is important that shop fronts are well-designed: attractive frontages not only improve the appearance of the AONB, they attract customers and contribute to the economic success of a business.
- Shop fronts should maintain a locally characteristic street scene as opposed to maintaining a generic, or nationally used, corporate image.
- Shop fronts should respect the existing character, including the historic and architectural period, of the building itself and other buildings in the local area. This integrates them with the building and street scene.

10.2 Signage

(Advertising sign along grass verge)
Many businesses in the AONB require signage. Such businesses include shops, pubs, Bed & Breakfasts, petrol stations and sports and recreation facilities.

Issues to consider:

- Signage should be sensitive to the building it is installed on and/or to the surrounding landscape. Colours, materials and reflectivity are important considerations to minimise landscape impacts.
- Some buildings may be so sensitive to change that no signage would be acceptable on the building itself.

(This self supporting sign does not detract from the building due to its simplicity and sensitive colours)

10.3 Links to ‘shop front and signage’ resources:

- Herefordshire Council Shop Front Design Guide  
- Malvern Hills District Council Shop Front Design Guide  
11. Other development

The principles set out in the previous chapters, for ‘Domestic buildings’ and ‘Farmsteads and agricultural buildings’ can be used to reduce the impact of other developments such as recreation facilities and horse stabling. This chapter provides additional information for other types of development.

11.1 Horse related development

Keeping horses often requires buildings to shelter horses or to store equipment. The following guidelines should be considered alongside ‘Guidance on Keeping Horses in the Landscape’ produced by the Malvern Hills AONB Partnership.

Issues to consider:
- It is usually most appropriate to convert existing buildings for keeping horses. Where this is not possible carefully consider the siting, scale, design, materials, colour and boundaries of new developments.

11.2 Recreation and sports facilities

Recreation and sports facilities can include pitches, club houses and changing rooms. These developments should be designed in a way that is appropriate and adds to local landscape character.

Issues to consider:
- Follow the design principles highlighted in the ‘Domestic buildings’ chapter.
- To prevent facilities from eroding the rural landscape character, integrate them into the landscape through tree or hedgerow planting, appropriate surfacing and boundary treatment. The ‘Garden and boundaries’ chapter provides further information.
- If acceptable in principle, consider and minimise, the impact of any flood lighting on the surrounding landscape (see ‘Lighting’ section on page 58).

11.3 Developments in gardens

This type of development relates to the dividing up of larger gardens associated with existing development to enable further, new development for residential purposes. These can range from entirely new dwellings with their own curtilage to small ‘granny flats’ associated with the existing building. This kind of development can impact upon both the setting of the original house and the wider settlement pattern.

Issues to consider:
- A new dwelling in a garden will only be acceptable where it can be proved it does not negatively affect the character of the existing building or the existing settlement pattern.
11.4 Apartments

There may be locations in more settled areas where small apartment buildings could be appropriately located. Generally, in the open countryside new apartment developments could have a serious impact on the Malvern Hills AONB and would not be acceptable. This is particularly the case where the landscape is open, and apartment buildings would be out of scale with the existing buildings.

(These apartments have been rendered converted in a villa style to fit into the local character)

(One of the first water cure establishments now to apartments)

Issues to consider:

- The principles of good design, scale and mass discussed in the ‘Domestic buildings’ chapter should be considered in the design of apartments.
- The location of apartments should be carefully considered and only sited in areas where they would not impact on character and settlement pattern or be out of scale with existing buildings e.g. areas where Victorian villas are characteristic may be able to accommodate new apartments.
- Consider the density of development, avoiding developments which comprise such a large number of units that they would be out of scale with surrounding buildings.
- When converting existing buildings to apartments consider the impact on the character of the building to be converted. The principles set out in ‘Alterations and conversions’ of this document should be considered.
- The impact of additional parking requirements and other ancillary structures such as communal bin/ recycling areas should be considered and carefully designed (see ‘Gardens and boundaries’ chapter).

11.5 Links to ‘other development’ resources:

12. Materials

Local building materials used in the Malvern Hills AONB make a strong contribution to landscape character because for a long time, due to the lack of transportation, the local landscape was the only source of construction materials. As a result of the varied landscape in the AONB a variety of local building materials have been used, often within the same development, including timber frames with wattle and daub or brick infill, traditional local red brick, Malvern stone, limestone and sandstone. The use of these local materials enhances the character of the AONB as they provide a link between development and the local landscape.

In many cases a mix of materials has become characteristic of development in the area, for example, a timber framed cottage with a red brick extension and stone chimney. Larger domestic buildings found in more settled areas of the AONB include a mix of materials, for example, yellow or blue brick dressings on red brick buildings or ashlar dressings on stone buildings. A variety of materials are also used on agricultural buildings, including timber framing with brick infill, weatherboarding, stone or traditional local brick. Modern agricultural buildings tend to use corrugated metal cladding or timber.

Issues to consider
- The use of locally characteristic materials is generally preferred as they provide a link with the local landscape. Carefully consider the use of modern materials to ensure they are an appropriate colour and texture which will enhance the local landscape character and not detract from it.
- Consider the sustainability of materials. Aim to source materials locally and think about the production processes involved in producing the material. For example, some man-made materials, such as uPVC, have a negative impact on the environment: uPVC is a plastic derived from the non-renewable resource of oil and uses a high amount of energy during production.
- Where it is characteristic, consider a mix of different materials to add to the variety of development in the AONB, e.g. a red brick chimney or a stone extension on a timber building.

12.1 Reclaimed or recycled materials

There is a growing opportunity to use materials which are recycled, such as timber cladding made from recycled materials, or materials which have been reclaimed. These can be regarded as preferable because they are more sustainable as they retain embodied energy from their manufacture meaning that no new materials are quarried or extracted, reducing environmental impacts.

Issues to consider:
- When considering the use of recycled materials it is important to assess their overall sustainability in terms of the energy or carbon required to manufacture or transport the material and ensure their manufacture and processing makes them a suitable and sustainable alternative. The UK Green Building Council and BRE can help to assess the sustainability of materials.
Consider the use of locally reclaimed materials. The use of locally reclaimed materials can help a development respect local character: they are usually already weathered/aged and help to ensure that the colours, shapes and textures are appropriate, particularly when seeking to ‘match’ materials on older buildings as part of alteration or upgrade works. However, it is important to consider the source of such materials as occasionally the availability of second hand materials may be linked to damage or theft to other buildings.

It may be possible to reuse and salvage materials, including stones, bricks or clay tiles during alteration and upgrade work from the original building being renovated if the materials are still sound.

12.2 Timber

Buildings in the Malvern Hills AONB testify to the use of locally-grown timber from the medieval period. These buildings are mostly concentrated in the wooded landscapes to the west of the Malvern Hills, where good quality wood was readily available.

Issues to consider:

- Consider the use of timber which reflects that found locally in the AONB. Local timber is preferable as this reflects its traditional use in the AONB, is a sustainable resource, and can be more cost effective than other materials.
- The use of a timber frame reflects a characteristic and traditional construction method used in areas of the AONB. Some experts now recommend that the timber frames are externally clad rather than in-filled (which was the traditional method), as in-fill panels can leak and do not offer the same levels of insulation.
- Consider the most appropriate modern timber products to clad buildings: The variety and flexibility available can provide a range of creative options. Local timber or timber which reflects that found locally will have a greater positive impact on enhancing landscape character. Options include: timber boards, used vertically or horizontally, spaced apart or overlapping; SIPs (Structural Insulated Panel Systems) and solid wood panels which are later rendered, limewashed or painted. An architect, designer or a timber expert can advise on the suitability of the different timber products for specific developments. The sustainability of the source of such materials should be considered.
- External walls on agricultural buildings can be clad in timber weatherboarding, Yorkshire boarding, vertical overlap boarding or feather edge boarding.
• In wooded landscapes consider the use of timber boards fitted vertically as this can help buildings better assimilate into the landscapes due to the vertical nature of tree cover.

• Timber found locally, such as oak, can be left to weather naturally, or treated with a clear stain to allow its natural colour to show, it is unnecessary to artificially colour it. Where timber does not reflect the colours of the timber found locally, it may be necessary to colour this to ensure it complements the surrounding landscape.

• Where render or paint is characteristic, timber panels can be rendered, limewashed or painted.

• Consider the use of timber alongside another material such as brick or stone, especially where a mix of materials is characteristic.
12.3 Brick

From the end of the 18th century red brick became a key building material, initially used for higher status homes and chimney stacks. Later, red brick was used to re-front timber framed buildings or replace wattle and daub panels. Although red brick generally dominates in the Malvern Hills AONB, blue and yellow bricks were used, especially during the Victorian periods and in the more settled areas, alongside red brick.

Historically, the red brick used in the AONB would have been handmade, creating bricks in soft, mellow shades with a textured finish. Machine-made brick was commonly used from the mid 19th century.

Issues to consider:

- Consider the colour, texture and size of any brick and mortar to ensure it complements, and is not at odds, with characteristic brickwork. It is preferable to use traditional handmade bricks or reclaimed bricks where possible. Machine made bricks which replicate the appearance of traditional handmade bricks may also be acceptable to reduce costs.

(Hard, white mortar is uncharacteristic of the area)
• Consider using a mix of different soft shades of red brick in one building, rather than one standard shade throughout, as this may help to avoid uniformity and complement the traditional red brick.

(New red brick house, responding to immediate local context at Upper Welland)

(The use of various mellow shades of red brick softens the colour, avoids uniformity and helps to respect local characteristics)

• Consider the bond used when constructing brick buildings: this can affect the appearance of the building in the landscape. Traditionally, brick buildings in the Malvern Hills AONB are constructed using a Flemish or English bond. Often a more modern, stretcher (or running) bond can appear out of character.

Examples of different brick bonds used in the AONB

(English Bond)  (Flemish Bond)
12.4 Stone

From the late 18th century onwards, local stone was increasingly used in the Malvern Hills AONB. The variety of stone used shows how buildings can reflect the huge variations in landscape and local geology which exist in the area. For example: Malvern stone is dominant in areas close to the Malvern Hills themselves, such as West Malvern; Arden Sandstone was quarried and used in the Unenclosed Commons to the east of the Malvern Hills; and limestone is common in the south of the AONB, associated with the Eastnor and Bromesberrow Estates.

Where stone is used, it is generally not ‘finished’ or processed and is therefore roughly shaped into blocks, known as ‘rubble’ stone. Some of the stones of the area split into roughly rectangular blocks and can be laid in courses although the varying sizes of stones mean that the courses are of different thicknesses. Other stones, such as Malvern stone, break into irregular blocks making coursing difficult and so are usually laid ‘randomly’.

Issues to consider:

• Consider the use of local stone where it is characteristic in the AONB. It is important to follow the characteristic stone and style of construction used locally. This includes the size and shape of blocks, the bond pattern and mortaring technique used on buildings and boundary walls locally.
• Where stone is to be used for new buildings, extensions or alterations, it should be sourced, if possible, local to the AONB. Sometimes, it may not be possible to source new supplies of characteristic stone. In this case, consider sourcing reclaimed materials.

• Where only a small amount of local stone is available, this could be used for decoration, or stone features such as porches or chimneys.

• Where sufficient amounts of reclaimed local stone cannot be sourced, it may be possible to use stone from across the three counties of Herefordshire, Worcestershire or Gloucestershire where the shape, size, colours and textures of the stone reflect that of surrounding buildings. This helps to reduce the carbon footprint of the development and supports the local economy.

• A traditional lime mortar, as opposed to a cement based mortar is preferred when using natural stone as this is softer, more durable and flexible, and more characteristic.

12.5 Roofing materials

Plain clay tiles are the most common roofing material within the Malvern Hills AONB with Welsh slates used occasionally. Clay tiles are dark and matt, making them less prominent from long distances and reducing the visual impact of development on the landscape. The soft colour palette of Welsh slate can also complement the surrounding landscape. There are occasional thatched roofs within the AONB, usually on older properties. Thatching in the area would traditionally have used a wheat thatch but availability of such thatch in this country is now very limited. Water reed is now most frequently used but this is often sourced from outside the UK and thus may be far less sustainable. It is likely that buildings built before the 19th century employed a plain thatch style with little embellishment, later thatching can sometimes be more decorative.

(Characteristic roofing materials)

Issues to consider:

• Roofing materials should complement the materials and colours used locally and should generally be dark and matt.

• Thatch roofs should be maintained and not replaced with a different material.
  • Consult a local thatcher or Conservation Officer for more information about the characteristic thatching materials in the AONB.
Where possible, thatching materials should be sourced locally.

Work with your thatcher to replace the roof with a similar style, if in doubt, reduce embellishments and aim for a simple style.

- Green roofs may be appropriate in some areas of the Malvern Hills AONB, especially at the edges of settlement where they may help to integrate a building into the landscape. Green roofs have a variety of other benefits such as supporting biodiversity.

### 12.6 Links to ‘material’ resources:

- UK Green Building Council
  [http://www.ukgbc.org/content/materials](http://www.ukgbc.org/content/materials)

- BRE have produced a Green Guide to Specification which provides guidance of the environmental impacts of building materials
  [http://www.bre.co.uk/greenguide/](http://www.bre.co.uk/greenguide/)
13. Colour

Contrasts in colour are characteristic of development in the AONB, from the use of local timber, brick and stone to the use of strong colour, particularly white, for 19\textsuperscript{th} and early 20\textsuperscript{th} century villas and also for limewashing cottages and other houses. As a result, villas found fringing the lower slopes of the Malvern Hills can be prominent features in the landscape.

Choice of colour and shade for new development should be informed by an appreciation of local character and past trends. The local landscape and the significance of short and long distance views of the development should be key considerations. It is not the intention that colours should necessarily ‘match’ those in the landscape, but they should usually complement them, and as a general rule new development should not set out to be too prominent in the AONB landscape.

Issues to consider:

- In the open countryside of the AONB, where the natural colour of the characteristic materials is exposed, it is preferable not to apply an artificial colour to natural materials.
- Darker or earthy natural colours, which do not reflect much light, are generally preferred in the open countryside.
- Consider natural, muted colours which would have been characteristic on timber framed cottages when they were first built, including natural timbers and subtle tones of whites, off whites, yellow and cream for the infill, alongside the use of the now traditional black and white.
- Render or paint is characteristic in more settled areas such as West Malvern and Malvern Wells. Where it is characteristic, render or paint in colours which are sensitive to the surrounding backdrop of hills can add to the characteristic variety of buildings and prevent homogeneity. Consider muted, subdued shades of off whites, cream, yellow and pink.
- Garish or reflective colours and patterns should be avoided, particularly in the open countryside. The use of bright, brilliant or reflective paint shades should be avoided. Subtle shades are more characteristic and will weather better over time.
- Matt colours are preferred. Colours with a gloss or shiny appearance should be avoided.
• A 50/50 mix of matt black and rosewood paint may be appropriate for fences or sheds, as this is more discrete in the landscape and does not draw attention to these features which are generally considered urbanising.

• Ensuring that the colour of ornamentation is similar to that used on surrounding buildings will reduce the impact of new buildings, alterations or extensions: darker, non-reflective colours will help reduce the visual impact where this is desirable.

• When using coloured paints, modern, micro-porous paints can protect and preserve underlying timber and are thus more sustainable than some traditional paints.
14. Details

Details are small scale features which help tie buildings to the local area and provide local character. Details include windows, doors, chimneys and ornamentation.

14.1 Windows and doors

The position, arrangement, style and size of openings, such as windows and doors, are important aspects of building design: they help create a visual unity and rhythm to the building. These are important design considerations as they help to ensure that all elements in the building are in proportion, working as one to create a sense of completeness and quality.

The solid to void ratio is the proportion of wall area to the amount of openings on the exterior of a building. This is a key consideration in new development and when altering openings. Traditional building techniques created smaller openings thus older buildings tend to have a higher solid to void ratio than newer buildings which tend to have larger and more frequent openings. Positioning of openings also creates character in a building and helps define age, original design and purpose. Examples of positioning which define character include whether doors are centrally located on the main elevation or located to the side, and whether windows are located against the roof line or set further down.

Buildings in the Malvern Hills AONB display a range of window styles. On smaller, older buildings small casement windows with timber or metal frames are common. Larger sash windows are more prevalent on larger buildings such as rebuilt Georgian farmhouses. Dormer windows are also characteristic in some areas of the AONB. More decorative buildings can include large stone-mullioned windows.

14.1.1 Alterations to existing buildings

It may be necessary to make alterations to existing openings or create new openings when altering or converting an existing building. In some cases, it may be that the openings are being altered
because previous alterations have introduced uncharacteristic features to the building or because more energy efficient openings are required. The following provide some general principles. It may be necessary to seek further advice for listed buildings or those in a conservation area to ensure the style of openings are characteristic of the building.

Issues to consider:

- When altering a building the characteristic style, size, shape, proportion and position of doors and windows should be understood. In some cases previous changes may have resulted in uncharacteristic openings. Future changes should therefore be based on the original character and not informed by later alterations. Respect, and be sensitive to, this original character and the solid to void ratio of the building.

- Wherever possible, and where they are characteristic to the building they serve, existing openings should be used and their proportions maintained: adding new openings can damage the visual unity of the building. If it is necessary to add a new opening ensure there is enough wall space to do this sensitively and respect the age and style of the building.

- Openings should generally be in proportion with existing openings and sensitively located so as not to disrupt the building character.
When making alterations or replacing openings on timber framed buildings, openings should relate to the frame and structural characteristics.

If it is necessary to enlarge existing openings ensure this is done in proportion: for example, if windows are mainly tall and narrow then maintain this shape rather than using windows with a horizontal emphasis.

When introducing dormer windows to an existing building they should reflect the roof shape and pitch of the building and be lower than the ridge line. To maintain visual unity they should normally be directly above, and be smaller than, existing windows.
74

- Where double glazing is to be used in alterations and the window design needs to vary slightly to accommodate the extra thickness of the glass, keep the windows in proportion, respecting the solid to void ratio and ensuring they respect the age and style of the building.
- When replacing doors on an existing building the size of the new opening should not normally be larger than the original opening and should respect the style, decoration (or lack of), of the character of the building.
- The use of timber is generally preferred for doors and window frames as this is usually more locally characteristic and sustainable than other materials. UPVC window frames are not appropriate.

(This new timber door respects the building’s scale not being larger than the original opening. The porch respects scale and complements the door.)

14.1.2 New buildings

- The solid to void ratio should be a key consideration when designing a new building in order to create a building with visual unity and rhythm.
- Consider the openings of the characteristic buildings locally and respect their style, size, shape and position.
- Large areas of glazing on new buildings can sometimes appear out of character and can create visual impact as a result of glare. Large areas of glazing could be appropriate if consideration is given to design and specification:
  - Extensively recessed glazed areas, or those with screening, may increase the apparent solid to void ratio, reducing the impact on local character.
  - Darkened windows may reduce their visibility and impact on the character of the building.
  - Non-reflective glass will significantly reduce glare to the wider landscape.
  - Ensuring areas of glazing are broken up with other materials and are not continuous will reduce glare into the wider landscape.)
(The impact of large areas of glazing is reduced by timber canopy and anti-reflection glass, broken up by timber)

14.2 Chimneys

It is characteristic in the Malvern Hills AONB for houses to have at least one chimney. Older buildings of timber frame construction often have large exterior chimneys, sometimes with a bread oven projection to the side. Brick or larger dwellings often have tall brick chimney stacks, sometimes as later additions. Chimneys create visual interest in settlements and contribute to complex rooflines which may be a characteristic feature. Modern development has reduced this characteristic feature as there has been little need for chimneys for open fires, for cooking or heating. However, the use of woodfuel and wood burning stoves for heating is now more popular.

Issues to consider:

- Where exterior chimneys and chimney stacks exist they should be retained.
- Consider incorporating a traditional, characteristic open fire and chimney into a new development where exterior chimneys and chimney stacks are locally characteristic.
- If an open fire is not included, consider incorporating the central heating flue or wood burning stove into a chimney.
14.3 Ornamentation

Ornamentation provides decoration to buildings. It includes decorative lintels, keystones, cornice mouldings, pillars, segmental or gothic arches, ridge tiles, bargeboards, finials and carved patterns. Such decoration is mostly found on larger Victorian houses and villas, usually in settlements. Dwellings in the open countryside are generally simple and often free of ornamentation. Where ornamentation is characteristic, it creates variety between buildings.

Issues to consider:

- Detailing should be in context to the character and scale of the original building. Unless decorative buildings are characteristic locally, it is often more appropriate to use simple details that do not detract from the building’s character.
- It would generally be preferable to have a degree of variation between buildings, taking account of the ornamentation that is characteristic of the local area. The Local guidance provides more information on local characteristics.
• Ornamentation should reflect local character and where appropriate traditional craftsmanship.
• Materials used for ornamentation should be traditional, such as local stone or handmade brick, rather than modern materials such as plastics.
• Detailing on extensions or outbuildings should be subordinate to the detailing on the main property.

14.4 Links to ‘detail’ resources:

• English Heritage can provide guidance about listed buildings and Conservation Areas.
15. Energy and resources

A building using fossil fuels, rather than renewable energy, for space and water heating, or cooking, produces carbon and is contributing to climate change. The rising costs of energy can also put a strain on many household finances. This chapter highlights options and design considerations for reducing carbon emissions, generating renewable energy and adapting for climate change. Seek advice about installation and the different techniques for individual buildings particularly if you want to carry out any of the following suggestions to a listed or historic building or building in a Conservation Area.

National policies and initiatives highlighted in the ‘Links to resources’ should be considered alongside this guidance.

15.1 Energy efficiency and generating renewable energy

The energy efficiency of a building should be considered before thinking about generating renewable energy. Energy efficiency or conservation measures usually have no visual impact and will reduce the amount of energy required from renewable sources, reducing the amount of infrastructure needed and the initial cost of renewable energy production. Issues to consider:

- Consider how a new or existing building can be made more energy efficient. This can be achieved by:
  - Reducing heat loss through leaks in the building fabric, such as walls, roof, windows and external doors, which may make it difficult and costly to keep the building warm.
  - Exploring ways to provide adequate ventilation during warmer temperatures and control moisture levels, for example, consider using a natural ventilation system or mechanical ventilation with heat recovery.
  - Including passive design features: using the landform, layout and orientation of buildings to maximise natural light and passive solar heat gain.
  - Exploring the use of new materials with a high thermal mass to regulate temperature fluctuations in summer and winter and reduce energy demands.

- Once the energy efficiency of the building has been considered, explore the potential for small scale renewable energy which suits the needs and respects the character of the building and local landscape. The following should be key considerations:
  - Explore renewable energy options at the concept design stage to ensure they integrate into the building and are sensitive to the landscape. Additional space may be required and the building should be able to accommodate any additional load requirements.
  - Consider combining different complementary technologies.
  - It may be necessary to install or use conventional carbon emitting technologies as a top up when the renewable technology is not able to produce sufficient energy.
The following are suggested renewable technologies. Further information about installing these technologies and design considerations, including more detailed guidance from the Malvern Hills AONB Partnership, can be found in the ‘Links to resources.’

- **Woodfuel** - A biomass boiler uses wood chips, wood pellets, logs or grasses instead of fossil fuels. Given the significant amount of woodland within the AONB this technology may be particularly appropriate since it can help to stimulate and sustain woodland management. The Forestry Commission provides useful advice about woodfuel and its benefits to land management and biodiversity.

- **Solar electricity** - Electricity for your building can be generated from photovoltaic panels installed on a roof, on the elevations of a building or as stand-alone panels.

- **Solar thermal (solar water heating)** - After space heating, the biggest energy demand is water heating. Solar water heating can provide the majority of hot water for a domestic property, although it may require further heating with a boiler/immersion heater during winter.

- **Heat pumps** - Heat pumps absorb heat from the ground, water or air. Heat pumps can be carbon free if the electricity driving them is from renewable sources.

- **Small scale wind** - Large scale wind farms are not appropriate in the AONB. Small wind turbines for the generation of energy, e.g. a single building’s electricity, may be appropriate in certain circumstances.
15.2 Water management

There is increasing pressure on our water supply from the growing population and as a consequence of climate change. Sustainable management of water should be considered at the outset of a building design.

Issues to consider:

- Explore options for sustainable drainage systems to manage surface water run-off around a development and ensure water drains as it would in a natural system, particularly during heavy rainfall, to minimise the chances of flooding. It may be necessary to consult a flood or hydrology expert, especially for a larger development or site that is inclined to flood.
- Depending on the size of the site, sustainable drainage systems can be small scale, with a small garden pond or large scale, including a system of drainage ditches, ponds and wetlands.
- Incorporate soft surfaces around the building to reduce water run-off.
- Where hard surfacing is required use porous surfaces which enable water to drain, e.g. crushed or loose stone or gravel.
- Restoring or enhancing water features e.g. ponds or culverted watercourses can help store water for use in the garden and to reduce the impact of heavy rainfall and flooding.
- Consider rainwater harvesting to collect rainwater for future use, or grey water recycling, to clean and reuse domestic waste water produced from activities such as washing dishes and clothes.

15.3 Waste management

Waste must be carefully managed and planned at the outset of all developments.

- Consider the type of waste that will be generated and map its route from the point it is produced to the point it is stored, recycled or collected in a Waste Management Plan. These can be required by some national standards such as the Code for Sustainable Homes.

15.4 Links to ‘energy’ resources:

- Environment Agency provides guidance about a variety of issues including Sustainable Urban Drainage and Climate Change. [http://www.environment-agency.gov.uk/](http://www.environment-agency.gov.uk/)
- Forestry Commission provide further information about woodfuel. [http://www.forestry.gov.uk/forestry/INFD-6PGGQR](http://www.forestry.gov.uk/forestry/INFD-6PGGQR)
- Pond Conservation provides advice about creating ponds for wildlife. [http://www.pondconservation.org.uk/advice/makingpondsforwildlife](http://www.pondconservation.org.uk/advice/makingpondsforwildlife)
16. Community planning

It is important to consider this Building Design Guide and to incorporate building design advice within community plans, such as Parish Plans, Village Design Statements, Neighbourhood Plans and Neighbourhood Development Orders. These are vital community planning tools which the community, with support from the local authority, can utilise to create a vision for their area.

Design Council CABE has collated a variety of documents which provide advice and toolkits about how to be successful in community planning.

High Hills and Slopes

1. Key characteristics of High Hills and Slopes

1.1 Landscape and setting

- **Settlement and location**: An unenclosed and sparsely settled landscape associated with a high ridge of ancient igneous and metamorphic rocks.
- **Infrastructure**: Roads are sparse, with path and untarmacked trackways, mainly Victorian in origin, crossing the slopes and reflecting the cultural heritage of the area as a spa resort.
- **Boundaries**: Buildings often have no boundary to the wider landscape. Where they do exist, low wall boundaries of Malvern Stone are characteristic.
- **Treecover**: Wooded land cover on lower slopes and mixed ornamental woodlands associated with some developments.
- **Topography**: Steeply sloping.

1.2 Domestic buildings

- **Dominant local character**: Victorian houses, two storey simple cottages and quarrymen’s cottages.
- **Recent building additions**: Inter-war and post war development.
- **Significant features**: There is no dominant building style; Malvern Stone buildings are common due to the historic supply of stone from local quarries.
- **Materials**: Mix of stone, red brick and timber framing.
1.3 Farmstead and agricultural buildings

- **Dominant local plan type**: Form varies with linear plan types, loose courtyard, regular courtyard and dispersed plan types.
- **Dominant local character**: Simple, with two storeys and a rectangular plan form.
- **Significant features**: Most farmsteads originated as smallholdings but have historically been enlarged.
- **Materials**: Red brick, some farmsteads are rendered.

2. Local guidance

Local issues to consider:

- **Landscape and setting**: Maintain the unsettled character of the landscape: Due to the unsettled nature there is very limited opportunity for new development.
- **Landscape and setting**: Maintain the views to and from the Malvern Hills. Buildings should not detract from, or dominate, these views.
- **Domestic Buildings**: New buildings should creatively reflect and complement locally characteristic buildings.
- **Domestic Buildings**: Relate to the steeply sloping landform and topography by extending storeys down or up the slope.
- **Farmsteads and agricultural buildings**: New agricultural development would not normally be appropriate in this landscape. Instead alter existing buildings or sensitively replace a building which has become neglected and disused.
- **Gardens and boundaries**: Due to the open nature of this landscape it would be appropriate to limit the amount of planting in gardens. New woodland planting is generally inappropriate.
- **Gardens and boundaries**: Where boundaries are required a low Malvern stone wall may be appropriate.
- **Materials**: Enhance the characteristic use of red brick, Malvern Stone or timber framing. Malvern Stone is preferred where available.
- **Materials**: Ensure materials, including areas of glazing, are non-reflective and do not impact on views.
- **Colour**: Light, neutral or earthy tone, renders can be appropriate in this landscape.
- **Details**: Limit ornamentation on buildings in this landscape where simple and unadorned buildings are characteristic.
1. Key characteristics of the Principal Wooded Hills

1.1 Landscape and setting

- **Settlement and location:** Sparse settlement characterised by dispersed historic farmsteads, occasional smallholdings and isolated farm buildings with occasional clusters of buildings.
- **Infrastructure:** A network of rural lanes running through narrow wooded valleys and dingles.
- **Boundaries:** Characteristic tall, mixed native species hedgerows of hawthorn, blackthorn, holly, hazel, wild privet and field maple.
- **Treecover:** Significant ancient semi-natural woodland with large, irregularly shaped woodlands and wooded streamlines often forming an interlocking pattern with surrounding thickly hedged fields and traditional orchards.
- **Topography:** Undulating, in places steeply sloping, rising locally towards the Malvern Hills.

1.2 Domestic buildings

- **Dominant local character:** Simple, 17th to 18th century timber framed cottages, many with 18th or 19th century alterations and larger red brick buildings of two storeys.
- **Recent building additions:** Some post-war development of red or brown brick.
- **Significant features:** Large, external brick or stone chimney breasts, sometimes with a bread oven.
- **Materials:** Timber frame buildings, red brick, limestone and some Malvern Stone.
1.3 Farmstead and agricultural buildings

- **Dominant local plan type:** Loose and regular courtyard plan types with some linear farmsteads.
- **Dominant local character:** 17th to 18th farmhouses, many altered or extended and later, larger farmhouses. Smallholdings, some enlarged, and isolated farm buildings are common.
- **Significant features:** Oast houses are present in this landscape. Farmhouses often have large exterior chimney breasts.
- **Materials:** Early farmhouses are timber framed, later are red brick. Many farmhouses built on a plinth of red brick or rubble stone. Farm buildings vary with timber framing, stone, red brick and weather boarding.

2. Local guidance

Local issues to consider:

- **Landscape and setting:** Maintain the sparsely settled and wooded character of the landscape avoiding development on ridgelines.
- **Landscape and setting:** Maintain ancient woodland and mature trees.
- **Domestic Buildings:** New development, alterations and conversions should respect the characteristic simple plan form and small scale of no more than two storeys.
- **Farmsteads and agricultural buildings:** Maintain and enhance the scale and agricultural character of smallholdings and isolated farm buildings.
- **Farmsteads and agricultural buildings:** Isolated farm buildings tend to have little or no infrastructure in the form of roads etc. This character should be maintained, in most cases, new tracks, roads or cabling would not be appropriate.
- **Gardens and boundaries:** Maintain and enhance characteristic tall, mixed species hedgerows.
- **Gardens and boundaries:** Maintain and enhance the wooded character of this landscape through the planting of native tree species, particularly oak, in gardens.
- **Materials:** Enhance the characteristic mix of local materials including timber, limestone and hand-made red brick.
- **Colour:** The infill on timber framed buildings can been painted in mellow cream/yellow colours.
- **Details:** Respect the dominant local character by creatively reflecting characteristic features such as stone/brick plinths and external chimney breasts.
Wooded Hills and Farmland

1. Key characteristics of Wooded Hills and Farmland

1.1 Landscape and setting

- **Settlement and location:** Sparse settlement with an estate character; some buildings clustered in the small estate village or around former commons. Many farms and cottages are isolated along private driveways.
- **Infrastructure:** A network of narrow, rural lanes.
- **Boundaries:** Mixed species hedgerow boundaries of locally hawthorn, blackthorn, hazel, field maple and wild privet. Occasional limestone walls.
- **Treecover:** Discrete, irregularly shaped ancient woods, traditional orchards and streamside trees.
- **Topography:** Varied undulating, in places steeply sloping, topography.

1.2 Domestic buildings

- **Dominant local character:** One and a half to two storey timber framed cottages dating from the 17th century. Larger two storey red brick or limestone houses.
- **Recent building additions:** There is a recent move to paint infill on timber framing mellow creams/ yellows.
- **Significant features:** Thatched roofs and exterior chimney breasts, brick ashlar end quoins on stone buildings, the traditional red paint of the Eastnor estate on bargeboards, doors and drainpipes.
- **Materials:** Timber framing, red brick and limestone.
1.3 Farmstead and agricultural buildings

- **Dominant local plan type:** Mix of regular courtyard plan types and loose courtyard plan types. Larger farmsteads show estate influence with multiyard farmsteads and covered yards.

- **Dominant local character:** Farmhouses usually two to three storeys high, many remodelled between the mid 18th to late 19th century. Small casement windows and larger sash windows are evident.

- **Significant features:** Red brick chimney stacks and exterior chimney breasts. Bargeboards and doors painted Eastnor red. Some oasthouses and mill buildings.

- **Materials:** Red brick with some timber framed farmsteads. Farm buildings mainly red brick, often with a timber frame, limestone or timber weatherboarding.

2. Local guidance

Local issues to consider:

- **Landscape and setting:** Maintain the dispersed and sparse pattern of settlement: Due to the sparse settlement there is limited opportunity for new development.

- **Landscape and setting:** Maintain and enhance woodland, including ancient woodlands and orchards.

- **Domestic Buildings:** Maintain the characteristic simple plan form and small scale of buildings.

- **Farmsteads and agricultural buildings** Continue the characteristic mix of using two or three materials on agricultural buildings.

- **Gardens and boundaries:** Maintain and enhance native, mixed species hedgerow. Limestone walls would also be acceptable.

- **Gardens and boundaries:** Maintain and enhance the wooded character of this landscape by planting native tree species, particularly oak, in gardens.

- **Materials:** Enhance the characteristic use of timber on buildings through continuing its use with timber framing and cladding with timber boards or timber panels.

- **Colour:** Where appropriate, continue the use of Eastnor red paint on detailing for both domestic and agricultural Estate buildings.

- **Details:** Respect local character by creatively reflecting local characteristics e.g. exterior chimney breasts, steeply pitched roofs, brick ashlar end quoins on stone buildings.
Principal Timbered Farmlands

1. Key characteristics of the Principal Timbered Farmlands

1.1 Landscape and setting

- **Settlement and location:** Clustered pattern of farmsteads, rural dwellings with occasional small villages and hamlets. Farmsteads are occasionally within hamlets or villages but more often, are isolated along tracks and minor roads.

- **Infrastructure:** Irregular network of winding lanes with thick roadside hedges.

- **Boundaries:** Mixed species hedgerows, of hawthorn, blackthorn, holly, hazel, and dogwood and scattered mature, hedgerow trees.

- **Treecover:** Irregular shaped blocks of woodland of ancient character. Buildings are often located against a backdrop of trees.

- **Topography:** Low lying, rolling with occasional steep sided hills.

1.2 Domestic buildings

- **Dominant local character:** 17th and 18th century timber frame cottages and houses of two or three bays, limestone or red brick wayside dwellings. Many with 19th and 20th century red brick extensions.

- **Recent building additions:** 20th century development in more settled areas.

- **Significant features:** Large exterior chimneys, occasionally with bread oven projections.

- **Materials:** Mix of timber, limestone and red brick, with timber or metal casement windows.

(Examples of timber frame buildings in the Principal Timbered Farmlands)
1.3 Farmstead and agricultural buildings

- **Dominant local plan type:** A mixture of regular and loose courtyard farmsteads, usually intimate in scale: regular courtyards are more common in the north and loose courtyards more common in the south.

- **Dominant local character:** Three to four bay timber frame farmhouses of up to 2 storeys and an attic and occasional substantial rebuilt red brick Georgian farmhouses of up to 3 storeys. Farmsteads are mostly isolated in the landscape.

- **Significant features:** Examples of farmsteads with one or two hop kilns, some with the original cowl on the roof.

- **Materials:** Mix of timber and red brick, with metal or timber casement or sash windows.

(Examples of characteristic farm buildings in the Principal Timbered Farmlands)

2. Local guidance

Local issues to consider:

- **Landscape and setting:** Maintain the clustered settlement pattern with unsettled land between, and the characteristic location of buildings set back from the road in their own grounds.

- **Domestic buildings:** New development, alterations and conversions should respect the simple character in design, materials and massing.

- **Farmsteads and agricultural buildings:** New agricultural building should retain and enhance the diverse built character and historic features e.g. hop kilns and timber framed barns.

- **Gardens and boundaries:** Maintain and enhance characteristic mixed species hedgerows and buildings set amongst a backdrop of native trees including oak, hazel and birch. Boundaries such as fencing and non-native hedgerows could be replaced with thick, mixed species native hedgerows, or stone walls in the more settled areas.

- **Materials:** Enhance the characteristic mix of materials including timber, red brick and limestone e.g. by including a red brick chimney or a stone extension on a timber-framed building or a stone plinth on a red brick building.

- **Details:** Respect the dominant local character by creatively reflecting local characteristics e.g. large exterior chimneys, bread oven projections, or steeply pitched roofs. Retain such characteristic features when making alterations or extensions.
1. Key characteristics of Forest Smallholdings and Dwellings

1.1 Landscape and setting

- **Settlement and location**: Intimate pattern of settlement traditionally characterised by strings of small and modest wayside cottages and smallholdings built alongside open common land. Most of the settlement of Wellington Heath is included in this landscape type.

- **Infrastructure**: A network of narrow winding lanes, often defined by tall hedges with hedgerow trees, broadly following the hill ridges and valleys.

- **Boundaries**: Mixed species hedgerows of hawthorn, blackthorn, holly, hazel, dogwood. Hedgerow trees include oak and fruit trees.

- **Treccover**: Historic orchards and wood pastures.

- **Topography**: Varied, from hill ridges down to lower valleys.

1.2 Domestic buildings

- **Dominant local character**: Historically, character comprised small, simple wayside dwellings, some with just two rooms, built by the first occupants and therefore each of highly individual and unique character. Some smallholdings and historic farmsteads exist; these have been altered or converted.

- **Recent building additions**: Post-war development along roads and some 21st century development. Enlargements, extensions or alterations to older dwellings.

- **Significant features**: Uniform, post-war development has diluted the traditional, modest local building character and intimate settlement pattern.

- **Materials**: Historically timber frame construction, often combined with, or built wholly from, local stone or traditional, hand-made red brick. Post-war development consists of modern red brick.
2. Local guidance

Local issues to consider alongside the Parish Plan for Wellington Heath:

- **Landscape and setting:** Respect the rural, ad hoc settlement pattern of small wayside dwellings with open spaces between. Avoid dense development.

- **Domestic Buildings:** New development, alterations and extensions should respect the local character of modest buildings in terms of size, form, style and limited ornamentation.

- **Domestic Buildings:** Individual and unique buildings are preferable. Avoid uniform developments of identical buildings or larger buildings. Focus on creating character and identity between the different buildings to reflect the historic building character.

- **Domestic Buildings:** Maintain the simple, small scale, modest character and the integrity of historic buildings when carrying out alterations, extensions or conversions.

- **Domestic Buildings:** Avoid the enlargement of existing buildings and maintain open spaces between buildings. Buildings should be modest in size and style.

- **Gardens and boundaries:** Maintain and enhance characteristic hedgerow boundaries with hedgerow trees. Where opportunity allows, replace those which have been lost.

- **Gardens and boundaries:** Consider incorporating sustainable drainage in gardens to address the flooding which is occasionally experienced in Wellington Heath.

- **Materials:** Enhance the characteristic mix of materials including red brick, which reflects the softer, less uniform appearance of traditional handmade brick, stone which complements that used locally, and timber framing.

- **Colour:** Rendering on some buildings may be appropriate in this landscape. Muted, pale shades of white, yellow and cream would be most characteristic.

- **Details:** Maintain the simple form of development with limited ornamentation.
Settled Farmland with Pastoral Land Use

1. Key characteristics of the Settled Farmland with Pastoral Land Use

1.1 Landscape and setting
- **Settlement and location**: Small to medium scale settled agricultural landscape characterised by scattered farms, relic commons and clusters of wayside dwellings.
- **Infrastructure**: A network of narrow winding lanes.
- **Boundaries**: Native mixed species hedgerows of hawthorn, blackthorn and elm.
- **Treecover**: Scattered hedgerow trees, groups of trees around dwellings and stream side trees.
- **Topography**: Rolling lowland with occasional steep sided hills and valleys.

1.2 Domestic buildings
- **Dominant local character**: Isolated, simple wayside dwellings.
- **Recent building additions**: 20th century development, including red brick semi-detached houses and bungalows. Many older dwellings have been redeveloped.
- **Significant features**: Simple details including traditional red brick lintels and arches over openings. Buildings have at least one chimney with older red brick buildings having two. There is a mix of hipped and gabled roofs.
- **Materials**: Mainly red brick buildings with occasional stone or timber framed buildings.

1.3 Farmstead and agricultural buildings
- **Dominant local plan type**: Mix of loose and regular courtyard farmsteads with occasional smallholdings and isolated farm buildings.
• **Dominant local character**: Originally small and rectangular, many of the farmhouses have been altered and extended resulting in larger buildings with complex floor plans.

• **Significant features**: Tall red brick chimneys with narrow exterior chimney breasts. There tends to be little ornamentation associated with the farmhouses and buildings.

• **Materials**: Mainly red brick with older farmhouses timber framed with colour washed wattle and daub. Farm buildings often limestone with reinforcing red brick lintels, sills and quoins.

(Characteristic Settled Farmlands with Pastoral Land Use farmstead)

2. Local guidance

Local issues to consider:

• **Landscape and setting** Maintain the clustered settlement pattern along roads and narrow lanes, build within clusters where this would not over enlarge the settlement.

• **Landscape and setting**: Retain and manage field ponds near developments. It may be appropriate to create new field ponds with some developments.

• **Domestic buildings**: Maintain the local character of simple buildings in terms of form and style.

• **Farmsteads and agricultural buildings**: Maintain and enhance the built character of farmsteads, with farmhouses built from red brick or timber framing and farm buildings constructed from limestone with red brick detailing.

• **Gardens and boundaries**: Maintain and enhance locally characteristic hedgerows and tree groups around dwellings.

• **Materials**: Enhance the characteristic mix of materials including red brick and limestone. Using timber e.g. for cladding or weatherboarding would also be appropriate.

• **Colour**: Colours should complement existing building materials and be of earth, mellow tones.

• **Details**: Respect the local character by creatively reflecting locally characteristic simple details, e.g. around doors and windows, and small chimneys.
1. Key characteristics of the Sandstone Estatelands

1.1 Landscape and setting

- **Settlement and location:** Isolated brick farmsteads and clusters of wayside dwellings, often located along long driveways or narrow lanes, with accompanying country houses.
- **Infrastructure:** A network of narrow, rural lanes with verges often containing gorse and bracken.
- **Boundaries:** Mixed species hedgerows of hawthorn and blackthorn, along with hedgerow oak trees.
- **Treecover:** Discrete estate plantations, groups of trees and sparsely scattered mature hedgerow oak trees.
- **Topography:** An open rolling landscape.

1.2 Domestic buildings

- **Dominant local character:** Simple, small, 2 storey cottages, decorative estate cottages/houses and larger houses, up to 3 storeys.
- **Recent building additions:** 20th century development, particularly in Bromesberrow village.
- **Significant features:** Decorative elements e.g. ridge tiles, overhanging eaves, decoration around windows and blue green paintwork associated with the Bromesberrow estate.
- **Materials:** Sandstone buildings, often with traditional red brick quoins, red brick and occasional timber framing.
1.3 Farmstead and agricultural buildings

- **Dominant local plan type:** Many 19th century farmsteads, mainly regular courtyards with multiyard farmsteads, loose courtyard farmsteads and dispersed plan farmsteads.
- **Dominant local character:** Farmhouses have quite large floor plans, with 2 storeys and an attic. Agricultural buildings tend to be one and a half storeys high.
- **Significant features:** Dormer windows are characteristic on farmhouses in this landscape.
- **Materials:** Timber frame construction, either red brick infill, or rendered. Farm buildings are a mix of timber frame and red brick, stone barns with red brick end quoins and timber weatherboarding.

2. Local guidance

Local issues to consider:

- **Landscape and setting:** Maintain the settlement pattern of isolated farmsteads and clusters of wayside dwellings.
- **Landscape and setting:** Maintain the characteristic network of rural lanes and associated grass verges with minimum and discreet signage.
- **Domestic Buildings:** New development and alterations should respect the simple, small-scale and estate character of buildings.
- **Farmsteads and agricultural buildings:** Where a new farm building is essential consider its scale and siting: new buildings would be better sited as part of an existing farmstead or in less prominent locations.
- **Gardens and boundaries:** Maintain and enhance the characteristic mixed species hedgerows.
- **Gardens and boundaries:** Maintain mature or veteran trees. Plant new oak trees where possible in gardens and boundaries.
- **Materials:** Enhance the characteristic mix of materials including local sandstone and traditional red brick. Red brick should reflect the characteristic softer appearance of hand-made brick.
- **Colour:** Continue the use of Bromesberrow blue green paint on woodland detailing for both domestic and farm buildings on Estate property.
- **Details:** Continue the use of decorative details including overhanging eaves and decorative window surrounds.
Enclosed Commons

1. Key characteristics of the Enclosed Commons

1.1 Landscape and setting

- **Settlement and location**: Sparse settlement of isolated red brick farmsteads and clusters of wayside dwellings associated with former common land.
- **Infrastructure**: Straight roads, with wide grass verges and settlement often located at the end of trackways.
- **Boundaries**: Straight hedgerows of hawthorn, blackthorn and elm with scattered hedgerow trees including veteran oak trees.
- **Treecover**: Localised plantation woodlands and linear tree cover along watercourses.
- **Topography**: Gently rolling, lowland landform.

1.2 Domestic buildings

- **Dominant local character**: Simple, small, two storey wayside dwellings clustered around the edge of the commons, with principle elevations facing access roads.
- **Recent building additions**: 20th Century developments associated with the edges of nearby settlements. Wayside dwellings often extended to create double depth buildings or with rear projecting wings.
- **Significant features**: Wayside dwellings often have chimneys.
- **Materials**: Traditional red brick which is occasionally rendered or painted.

1.3 Farmstead and agricultural buildings

- **Dominant local plan type**: Mainly regular courtyard plan types with some loose courtyards and L Plan farmsteads.
- **Dominant local character**: Farmsteads tend to be 19th century in origin and located along the edges of unenclosed common land. There are some rebuilt Georgian farmsteads with 3-4 windows on the first floor and sash windows
- **Significant features**: Tall chimneys and some decorative elements such as lintels and sills.
- **Materials**: Mix of brick, timber framing, brick infill and weatherboarding. Characteristic farm buildings comprise traditional red brick, stone buildings with red brick quoining or occasional use of weatherboarding.
2. Local guidance

Local issues to consider:

- **Landscape and setting**: Maintain the sparsely settled character of the landscape: Due to the sparsely settled character there is very limited opportunity for new development.

- **Landscape and setting**: Maintain the characteristic roadside verges and seek to retain or create roadside verges in new developments.

- **Domestic buildings**: New buildings should reflect the simple form and character and complement the materials and colours of existing buildings.

- **Domestic buildings**: Consider the cumulative impact of previous extensions before planning a further extension to a dwelling: further extensions may be inappropriate.

- **Farmsteads and agricultural buildings**: Isolated farm buildings tend to have little or no infrastructure in the form of roads etc. This character should be maintained, in most cases, new tracks, roads or cabling would not be appropriate.

- **Gardens and boundaries**: Garden boundaries should be low and include locally occurring native species.

- **Gardens and boundaries**: To maintain rural character, the planting of ornamental trees and shrubs should be avoided. Planting in gardens should include locally occurring species, e.g. oak and willow.

- **Materials**: Enhance the characteristic use of traditional red brick. Timber would also be a suitable.

- **Details**: Maintain the local character by reflecting local characteristics such as a chimney.
Unenclosed Commons

1. Key characteristics of Unenclosed Commons

1.1 Landscape and setting

- **Settlement and location**: Settlement is mostly located along roads around open common land or as farm clusters on the edge in the small patches of enclosed land. Settlement on open common land occurs occasionally as small ‘islands’.
- **Infrastructure**: Roads generally run around the edge of the open common land.
- **Boundaries**: Native hedgerow boundaries of hawthorn, blackthorn and elm. Stone walls and some fencing around buildings. Generally boundaries are low, allowing view of the buildings. There are few boundaries associated with the unenclosed common land.
- **Treccover**: Scattered patches of secondary trees (mainly birch and oak) and groups of trees associated with settlement plots and gardens.
- **Topography**: Gently rolling, becoming more undulating along the eastern edge of the ridge of the Malvern Hills.

1.2 Domestic buildings

- **Dominant local character**: Small, simple red brick wayside dwellings, no more than two storeys in height with a 1-2 room rectangular plan form.
- **Recent building additions**: 20th century bungalows of red brick or stone and large modern developments which have replaced older dwellings.
- **Significant features**: Occasional timber framed buildings with wattle and daub infill, which are one storey with an attic.
- **Materials**: Red brick dominates. Some stone buildings have red brick detailing.
1.3 Farmstead and agricultural buildings

- **Dominant local plan type:** Farmsteads around the edges of the open common tend to be 19th century loose cluster farm plan types. Elsewhere, loose courtyard plan types from the 19th century dominant with some regular courtyard, linear and dispersed plan types.

- **Dominant local character:** Simple rectangular plan with gently pitched gable roof and small openings.

- **Significant features:** Brick chimneys, some large exterior chimney breasts.

- **Materials:** Red brick or timber frame construction with red brick infill. Dark weatherboarding on small barns is a feature in this landscape.

2. Local guidance

Local issues to consider:

- **Landscape and setting:** Maintain the unsettled character of the landscape ensuring buildings do not encroach onto the unenclosed open common land: Due to the unsettled, open character of this landscape there is little opportunity for additional buildings.

- **Landscape and setting:** Maintain the characteristic sparse treecover, limiting tree planting to groups around buildings.

- **Domestic Buildings:** New development, alterations and conversions should respect the characteristic simple, small scale appearance of buildings.

- **Farmsteads and agricultural buildings:** Extensions to farm buildings, especially farmhouses, would generally be inappropriate in this landscape where buildings are characteristically small.

- **Gardens and boundaries:** Gardens should not extend onto the open common. Garden boundaries should be minimal and include locally occurring hedgerow species.

- **Materials:** Enhance the characteristic use of red brick. It may also be appropriate to use other materials alongside the red brick, where the colour complements that of the red brick and surrounding landscape.

- **Colour:** Maintain the locally characteristic palette of colours which are influenced by the natural colour of the materials used. It is generally not appropriate to render or paint the main elevations of buildings.

- **Details:** Maintain and enhance the use of brick detailing on stone buildings.
1. Key characteristics of West Malvern

1.1 Landscape and setting

- **Settlement and location:** Dense settlement with a sense of enclosure due to planting in gardens and buildings which generally face towards roads, taking full advantage of the panoramic views from the steep slopes.
- **Infrastructure:** Parallel main roads follow the contours of the landscape, with diagonal roads joining them. Frequent on street parking caused by lack of off road parking for many buildings. Traditional gas lamps are a feature and water features provide a link to the area’s heritage as a spa resort.
- **Boundaries:** Large irregular blocks of rubble Malvern stone walls set in lime mortar, often terminating in brick (usually blue brick) at the entrance to properties. Sometimes with hedgerows behind.
- **Treetcover:** Ornamental trees can be found in larger gardens.
- **Topography:** Dominated by steep slopes with buildings utilising the landform and maximising space by extending some storeys down the slope.

1.2 Domestic buildings

- **Dominant local character:** Large Victorian and Edwardian villas, often Gothic in style with later Arts and Crafts. Occasional Victorian and quarrymen’s cottages.
- **Recent building additions:** 20th century development of bungalows and detached houses.
- **Significant features:** Highly varied forms and scales, including projecting wings and pitched gables. Decorative details include quoins, segmental and gothic arches, colourful ridge tiles, finials and bargeboards and large stone-mullioned windows, often in contrasting colours to the main elevations.
- **Materials:** Mix of materials and colours which creates a unique character; many of the residential buildings are built with a combination of irregular blocks of Malvern stone, red, yellow or blue brick.
2. Local guidance

Local issues to consider:

- **Landscape and setting**: Maintain the intimacy and sense of enclosure in this settlement by relating buildings to the steeply sloping topography, reducing the apparent scale of larger buildings, and by planting in gardens.

- **Landscape and setting**: New buildings should be within the linear settlement pattern and should not seek to expand West Malvern up or down slopes into open countryside.

- **Domestic Buildings**: New development should enhance the variety of architectural styles and details through the use of decorative openings, varied rooflines, chimneys, projecting wings or bay windows.

- **Domestic Buildings**: New development should carefully consider the visual impact of buildings on sites which slope up from the road to avoid a hard edge dominating the road. Consider setting back upper floors or including elements such as balconies or gable projections.

- **Gardens and boundaries**: Malvern stone wall boundaries which end in blue, or sometimes red, brick are preferred. Where Malvern stone is limited consider building a wall using Malvern stone as the facing material or a boundary which complements the colour and style of the Malvern stone boundaries, such as a blue brick wall with some Malvern stone detailing.

- **Gardens and boundaries**: Consider terraced gardens to make use of the landform. Where a high retaining wall is required, the characteristic materials should be used and softened with planting. Living walls could also be considered.

- **Lighting**: As an elevated location the use of outside lighting should be considered carefully.

- **Materials**: Continue the sustainable use of Malvern stone and enhance the existing variation and diversity through the creative use and mix of characteristic, or complementary, materials and colours.

- **Colour**: Enhance variety through the use of characteristic coloured paint or render, which complements the existing palette of colours found locally, usually muted, pale shades of cream/yellow, off-white, pink or blue. Avoid garishly bright colours, the use of several colours on one building and the use of one colour on several neighbouring buildings.
Colwall

1. Key characteristics of Colwall

1.1 Landscape and setting

- **Settlement and location:** Colwall includes Colwall Stone, Upper Colwall (both Conservation Areas) and Colwall Green. Panoramic views from the settlement emphasise the close relationship to surrounding open countryside. Settlement focuses along the main route.
- **Infrastructure:** Roads follow the contours of the landscape and have wide grass verges. The railway line also provides linear structure.
- **Boundaries:** Hedgerow boundaries with privet hedges in the centre of the village and mixed species hedgerows of hawthorn, blackthorn, holly, hazel, dogwood more common on the edges of the village.
- **Treecover:** Densely wooded areas, patches of parkland and road side trees.
- **Topography:** A sloping settlement, the main route runs from higher slopes in the north east to flatter agricultural land in the south west.

1.2 Domestic buildings

- **Dominant local character:** Character varies with 17th to 18th century cottages, larger Victorian and Edwardian houses.
- **Recent building additions:** 20th century developments radiate on roads and lanes off the main route through Colwall Stone.
- **Significant features:** There is a great mix of architectural styles and decorative details in Colwall, resulting from various stages of development throughout its history.
- **Materials:** Red brick is used for larger Victorian and Edwardian houses, sometimes with stone detailing. There are a significant number of stone buildings.
2. Local guidance

Local issues to consider alongside the Colwall Village Design Statement:

- **Landscape and setting:** Maintain the linear settlement pattern and the characteristic open spaces which are particularly evident on the settlement edge.
- **Landscape and setting:** Maintain and enhance the wide grass verges and associated tree planting. Tree species could include lime, cherry or other fruit trees.
- **Domestic Buildings:** Vary the scale, within existing parameters, and plan form of buildings to add variety to a new development.
- **Domestic Buildings:** Extensions should follow the character of the main building: if a building is simple then the extension should be; if a building is more decorative then the extension should have some degree of decoration.
- **Gardens and boundaries:** New developments should provide gardens large enough to set the buildings back from the road and be planted with locally occurring species.
- **Gardens and boundaries:** Maintain and enhance characteristic hedgerows with privet hedgerows in the centre of the village and mixed species hedgerows towards the edges of the settlement.
- **Materials:** Enhance the characteristic mix of materials including red brick or stone, limestone or Malvern stone. Red brick should reflect the characteristic softer appearance of hand-made brick with a soft, narrow lime mortar.
- **Colour:** It would be acceptable to render or paint some new buildings in a development. Muted, pale shades of white, yellow or cream would be most characteristic.
- **Details:** Respect local character by creatively reflecting local characteristics e.g. exterior chimney breasts, moulded decoration in brickworks and above openings, contrasting materials/colours on window surrounds and decorative ridge tiles.
Malvern Hills AONB Building Design Guide DRAFT

1. Key characteristics of Malvern Wells

1.1 Landscape and setting

- **Settlement and location**: Malvern Wells, includes Upper Welland and Welland. It is a settled landscape, dominated by steep slopes and fairly dense, linear settlement.

- **Infrastructure**: Roads run along contours, especially on the higher slopes. Traditional gas lamps are a feature and water features provide a link to the area’s heritage as a spa resort.

- **Boundaries**: Malvern Stone walls ending in red or blue brick, mixed species hedgerows of hawthorn, blackthorn and elm, stone walls with high hedgerow boundaries, occasional brick walls and wooden fencing.

- **Treecover**: Non-native, mature tree species in gardens.

- **Topography**: Steeply sloping upper slopes, with flatter common land to the east.

1.2 Domestic buildings

- **Dominant local character**: Varied: villas, large houses and more simple cottages. Most development is Victorian or Edwardian.

- **Recent building additions**: 20th century development is often situated between older properties.

- **Significant features**: Decorative detailing including gothic styling on some villas, coloured bargeboarding and contrasting stone work. Chimneys are characteristic in this landscape.

- **Materials**: Red brick and irregular rubble Malvern stone.
2. Local guidance

Local issues to consider:

- **Landscape and setting:** Respect the area’s close proximity to the surrounding rural landscape, relating to the steeply sloping topography in the west and the gentle common land in the south east.

- **Landscape and setting:** Maintain the characteristic pattern of roads which follow contours in the landscape and are lined with buildings.

- **Domestic Buildings:** Maintain and enhance the variety of characteristic architectural styles and details.

- **Domestic Buildings:** Maintain variety between buildings, through materials, scale, details or by varying rooflines.

- **Gardens and boundaries:** Buildings should have small gardens rather than be set back in very large grounds or at the end of long driveways, particularly in the centre of the settlement.

- **Gardens and boundaries:** Maintain the characteristic boundary in the local area.

- **Car parking:**
  - **Lighting:** As an elevated location the use of outside lighting should be considered carefully.
  - **Materials:** Where possible, introduce elements of Malvern Stone into a development particularly where red brick is being used as the main building material.
  - **Colour:** Rendering or painting buildings can be appropriate. Use muted shades of colour which complement the existing palette of colours used locally.
  - **Details:** Respect local character by creatively reflecting local characteristics e.g. gothic styling, coloured bargeboarding, contrasting stone work and chimneys
BAP: Biodiversity Action Plan. The Malvern Hills AONB supports the UK BAP priority habitats and species outlined in the UK BAP, published in 1994, as well as those identified as being of local importance. The UK BAP describes the biological resources of the UK and provides detailed plans for conservation of these resources. Herefordshire, Worcestershire and Gloucestershire counties have developed biodiversity partnerships and written local BAPs.

Biodiversity
The variety of all living things on earth.

Built environment: refers to man-made structures in the landscape, ranging from just one building, to a whole city. In the Malvern Hills AONB it can include an isolated dwelling, a hamlet, a village or the roads that connect them.

Carbon emissions: The release of carbon into the atmosphere from energy use: A building which uses fossil fuels rather than renewable energy for space heating, heating water and cooking produces carbon, which is contributing to climate change.

Curtilage: a legal term to define the land immediately surrounding a house or dwelling within which the owner can expect privacy. This is not necessarily marked or enclosed but usually includes the garden, parking areas and any out-buildings.

Eaves: the lower outer corners of a roof. Their purpose is to carry rainwater away from the building wall.

Elevation: the front, sides or back of a building

Infilling: the use of vacant land within a village or town for development, helping to limit the growth of the village or town.

Landscape: landscape is more than just scenery. The European Landscape Convention defines landscape as ‘an area, as perceived by people, whose character is the result of the action and interaction of natural and/or human factors.’

Landscape character: a distinct, recognisable and consistent pattern of elements in the landscape that makes one landscape different from another, rather than better or worse.

Landscape Strategy: to provide direction and guidance on how the different landscapes of the Malvern Hills AONB can be managed in order to obtain optimum character, condition and sustainability.
Lichen: a partnership between two very different types of organisms; a fungus and an alga. Algae are very simple plants. The two are so closely interwoven that they appear as a single individual. Lichens can be found growing on bare rock, walls, roofs and monuments.

Lintel: the horizontal beam that can be found across the uprights of a door or window.

Patina: a coating that has developed over time and creates added character and texture, for example through weathering, oxidation and pollution marking brick/ stone or verdigris on copper or bronze.

Permeable: surfaces which are permeable allow water to penetrate through to underground, reducing surface water run-off and risk of flooding during heavy rainfall.

Recessed doorways: traditionally the shop door is slightly set back from the window display areas. This recognises the importance of the design and position of the doorway on the overall design.

Renewable energy: energy from renewable sources, meaning energy from non-fossil fuel sources, namely wind, solar, aerothermal, geothermal, hydrothermal and ocean energy, hydropower, biomass, landfill gas, sewage treatment plant gas and biogases.

Ridge: the elevated crest of the roofline

Sustainable development: Sustainable development meets the needs of the present without compromising the ability of future generations to meet their own needs.

Vernacular architecture: following the traditions which appear to be unique to the district or region in which they are found.

Tranquillity: the quality of calm experienced in places with mainly natural features and activities, free from disturbance from manmade ones.

Ventilation slits: Small openings in the wall of buildings to enable airflow.
